Trends – Artificial Intelligence (AI)

May 30, 2025

Mary Meeker / Jay Simons / Daegwon Chae / Alexander Krey

BOND

Context

We set out to compile foundational trends related to AI. A starting collection of several disparate datapoints turned into this beast.

As soon as we updated one chart, we often had to update another – a data game of whack-a-mole...
a pattern that shows no sign of stopping...and will grow more complex as competition
among tech incumbents, emerging attackers and sovereigns accelerates.

Vint Cerf, one of the 'Founders of the Internet,' said in 1999, '...they say a year in the Internet business is like a dog year – equivalent to seven years in a regular person's life.' At the time, the pace of change catalyzed by the internet was unprecedented.

Consider now that AI user and usage trending is ramping materially faster...and the machines can outpace us.

The pace and scope of change related to the artificial intelligence technology evolution is indeed unprecedented, as supported by the data. This document is filled with user, usage and revenue charts that go up-and-to-the-right...
often supported by spending charts that also go up-and-to-the right.

Creators / bettors / consumers are taking advantage of global internet rails that are accessible to 5.5B citizens via connected devices; ever-growing digital datasets that have been in the making for over three decades; breakthrough large language models (LLMs) that – in effect – found freedom with the November 2022 launch of OpenAI's ChatGPT with its extremely easy-to-use / speedy user interface.

In addition, relatively new AI company founders have been especially aggressive about innovation / product releases / investments / acquisitions / cash burn and capital raises. At the same time, more traditional tech companies (often with founder involvement) have increasingly directed more of their hefty free cash flows toward AI in efforts to drive growth and fend off attackers.

And global competition – especially related to China and USA tech developments – is acute.

The outline for our document is on the next page, followed by eleven charts that help illustrate observations that follow.

We hope this compilation adds to the discussion of the breadth of change at play – technical / financial / social / physical / geopolitical.
No doubt, people (and machines) will improve on the points as we all aim to adapt to this evolving journey
as knowledge – and its distribution – get leveled up rapidly in new ways.

Special thanks to Grant Watson and Keeyan Sanjasaz and BOND colleagues who helped steer ideas and bring this report to life.
And, to the many friends and technology builders who helped, directly or via your work, and are driving technology forward.

Outline

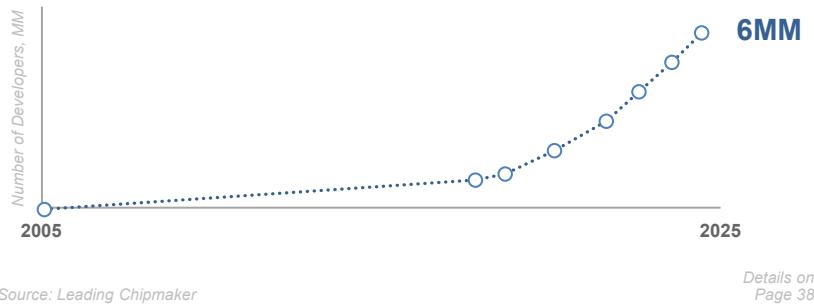

#	
1	Seem Like Change Happening Faster Than Ever? Yes, It Is 9-51
2	AI User + Usage + CapEx Growth = Unprecedented 52-128
3	AI Model Compute Costs High / Rising + Inference Costs Per Token Falling = Performance Converging + Developer Usage Rising 129-152
4	AI Usage + Cost + Loss Growth = Unprecedented 153-247
5	AI Monetization Threats = Rising Competition + Open-Source Momentum + China's Rise 248-298
6	AI & Physical World Ramps = Fast + Data-Driven 299-307
7	Global Internet User Ramps Powered by AI from Get-Go = Growth We Have Not Seen Likes of Before 308-322
8	AI & Work Evolution = Real + Rapid 323-336

AI & Work Evolution = Real + Rapid

USA IT Jobs – AI vs. Non-AI

Overview...

To say the world is changing at unprecedented rates is an understatement.

Rapid and transformative technology innovation / adoption represent key underpinnings of these changes.

As does leadership evolution for the global powers.

Google's founding mission (1998) was to 'organize the world's information and make it universally accessible and useful.'

Alibaba's founding mission (1999) was to 'make it easy to do business anywhere.'

Facebook's founding mission (2004) was 'to give people the power to share and make the world more open and connected.'

Fast forward to today with the world's organized, connected and accessible information being supercharged by artificial intelligence, accelerating computing power, and semi-borderless capital...all driving massive change.

Sport provides a good analogy for AI's constant improvements. As athletes continue to wow us and break records, their talent is increasingly enhanced by better data / inputs / training.

The same is true for businesses, where computers are ingesting massive datasets to get smarter and more competitive. Breakthroughs in large models, cost-per-token declines, open-source proliferation and chip performance improvements are making new tech advances increasingly more powerful, accessible, and economically viable.

OpenAI's ChatGPT – based on user / usage / monetization metrics – is history's biggest 'overnight' success (nine years post-founding). AI usage is surging among consumers, developers, enterprises and governments. And unlike the Internet 1.0 revolution – where technology started in the USA and steadily diffused globally – ChatGPT hit the world stage all at once, growing in most global regions simultaneously.

Meanwhile, platform incumbents and emerging challengers are racing to build and deploy the next layers of AI infrastructure: agentic interfaces, enterprise copilots, real-world autonomous systems, and sovereign models.

Rapid advances in artificial intelligence, compute infrastructure, and global connectivity are fundamentally reshaping how work gets done, how capital is deployed, and how leadership is defined – across both companies and countries.

At the same time, we have leadership evolution among the global powers, each of whom is challenging the other's competitive and comparative advantage. We see the world's most powerful countries revved up by varying degrees of economic / societal / territorial aspiration...

...Overview

...Increasingly, two hefty forces – technological and geopolitical – are intertwining.

Andrew Bosworth (Meta Platforms CTO), on a recent 'Possible' podcast described the current state of AI as *our space race and the people we're discussing, especially China, are highly capable... there's very few secrets. And there's just progress. And you want to make sure that you're never behind.*

The reality is AI leadership could beget geopolitical leadership – and not vice-versa.

This state of affairs brings tremendous uncertainty...yet it leads us back to one of our favorite quotes – *Statistically speaking, the world doesn't end that often*, from former T. Rowe Price Chairman and CEO Brian Rogers.

As investors, we always assume everything can go wrong, but the exciting part is the consideration of what can go right.

Time and time again, the case for optimism is one of the best bets one can make.

The magic of watching AI do your work for you feels like the early days of email and web search – technologies that fundamentally changed our world. The better / faster / cheaper impacts of AI seem just as magical, but even quicker.

No doubt, these are also dangerous and uncertain times.

But a long-term case for optimism for artificial intelligence is based on the idea that intense competition and innovation... increasingly-accessible compute...rapidly-rising global adoption of AI-infused technology...and thoughtful and calculated leadership can foster sufficient trepidation and respect, that in turn, could lead to Mutually Assured Deterrence.

For some, the evolution of AI will create a race to the bottom; for others, it will create a race to the top.

The speculative and frenetic forces of capitalism and creative destruction are tectonic.

It's undeniable that it's 'game on,' especially with the USA and China and the tech powerhouses charging ahead.

In this document, we share data / research / benchmarks from third parties that use methodologies they deem to be effective – we are thankful for the hard work so many are doing to illustrate trending during this uniquely dynamic time.

Our goal is to add to the discussion.

ChatGPT AI User + Subscriber + Revenue Growth Ramps = Hard to Match, Ever

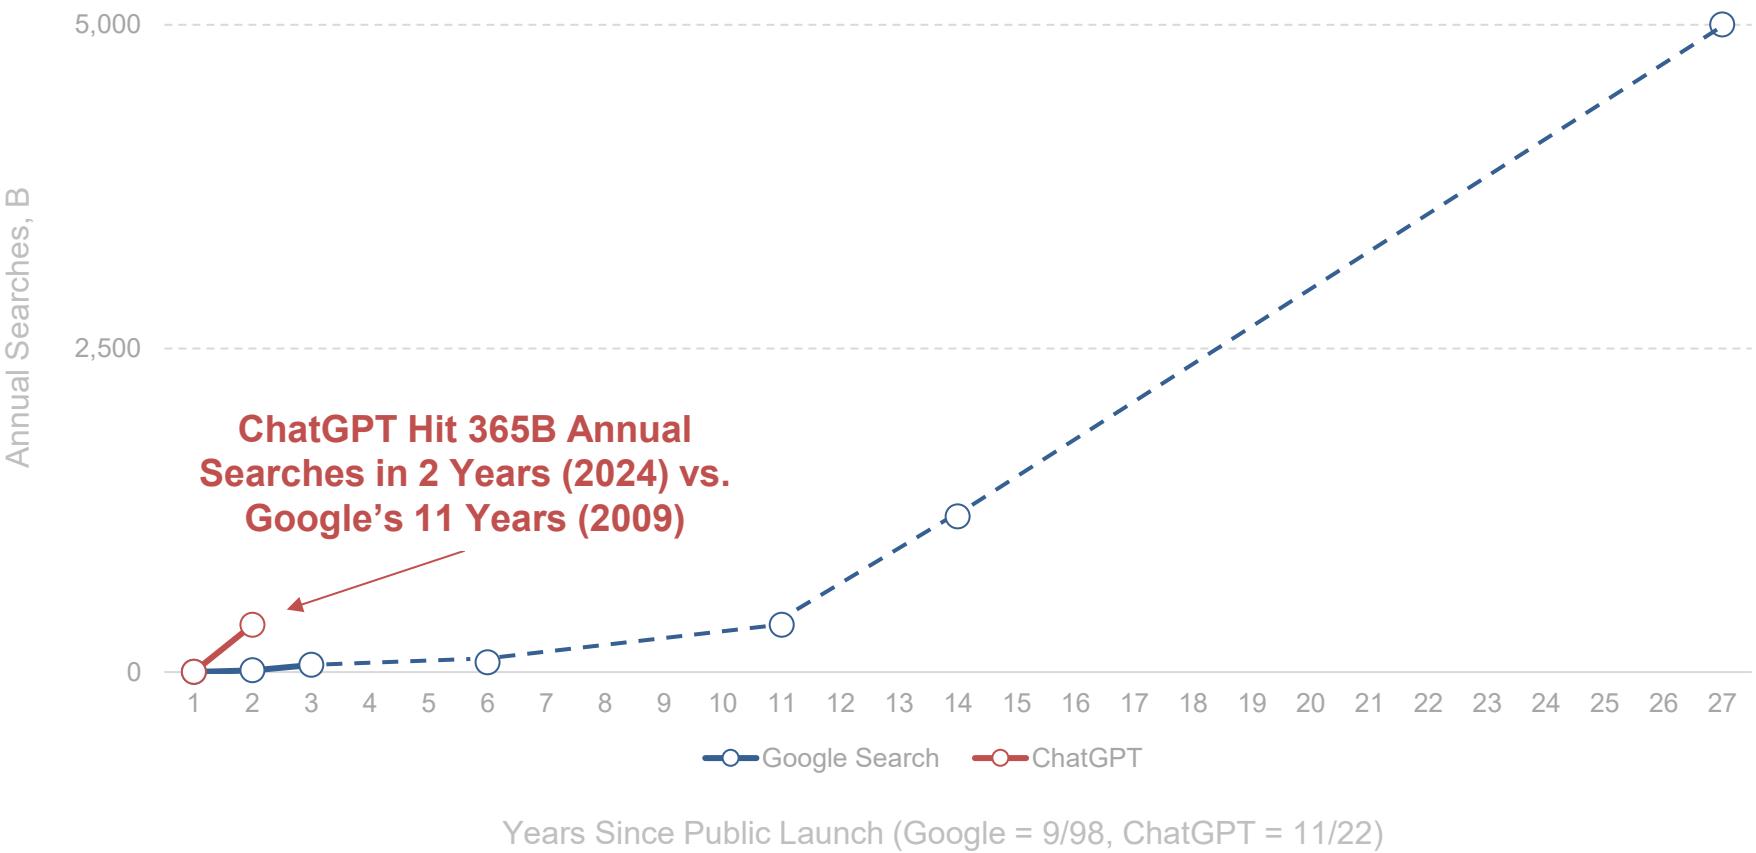

**ChatGPT User + Subscriber + Revenue Growth – 10/22-4/25,
per OpenAI & *The Information***

Note: 4/25 user count estimate from OpenAI CEO Sam Altman's 4/11/25 TED Talk disclosure. Revenue figures are estimates based off OpenAI disclosures. Source: OpenAI disclosures (as of 4/25), *The Information* (4/25) ([link](#), [link](#), [link](#) & [link](#))

Time to 365B Annual Searches = ChatGPT 5.5x Faster vs. Google

**Annual Searches by Year (B) Since Public Launches of Google & ChatGPT – 1998-2025,
per Google & OpenAI**

Note: Dashed-line bars are for years where Google did not disclose annual search volumes. Source: Google public disclosures, OpenAI (12/24). ChatGPT figures are estimates per company disclosures of ~1B daily queries

In 1998, tapping emerging Internet access, Google set out to
‘organize the world’s information and make it
universally accessible and useful.’

Nearly three decades later

– after some of the fastest change humankind has seen –
a lot of information is indeed digitized / accessible / useful.

The AI-driven evolution of how we
access and move information is happening much faster...

...AI is a compounder – on internet infrastructure, which allows
for wicked-fast adoption of easy-to-use broad-interest services.

Knowledge Distribution Evolution =
Over ~Six Centuries

Knowledge Distribution – 1440-1992 =
Static + Physical Delivery...

Global Impact of Generative AI on Knowledge Generation and Distribution

Global Impact of Generative AI on Knowledge Generation & Distribution

Generative AI's rapid advancement since 2022 has led to an explosion in AI-created content and widespread adoption across sectors. Below we compile quantitative global data (2023–2025) illustrating how generative AI is transforming knowledge **generation** (content creation) and **distribution** (sharing and access) in academia, media, education, enterprise, and beyond.

Surge in AI-Generated Content Creation

- Academic Publications:** AI is now contributing to scientific literature. An analysis found that 1% of all scientific articles published in 2023 showed signs of generative AI involvement. This amounts to an estimated 60,000 research papers potentially written (in part) by large language models. Top journals have responded – by late 2023, 87 of the 100 leading journals had issued guidance on using AI tools in writing – reflecting how commonplace AI-assisted writing has become in research.
- News and Media Content:** Generative AI is also writing the news. By mid-2024, about 6.96% of global news articles were AI-generated – roughly 60,000 AI-written news articles published per day. Misinformation trackers have identified 1,271 news and information websites across 16 languages that rely on AI-generated content with minimal human oversight (as of May 2025), a sharp rise from 467 such sites in 2023. Even reputable outlets use AI for routine reporting: the Associated Press, for example, was automatically generating 40,000 of its 730,000 news stories (5.5%) via AI by mid-2023. This automation has enabled greater volume and speed in news dissemination.

*We define the public launch of ChatGPT in November 2022 as the public release of Generative AI which we see as AI's 'iPhone Moment.' ChatGPT saw the fastest user ramp ever for a standalone product (5 days to secure 1MM users). Generative AI = AI that can create content – text, images, audio, or code – based on learned patterns.

Circa Q2:25

Top Ten Things AI Can Do Today, per ChatGPT

ChatGPT 4o ▾

- | | |
|--|--|
| 1. Write or edit anything
► Emails, essays, contracts, poems, code — instantly and fluently. | 6. Roleplay anyone you need
► Prep for interviews, simulate customers, rehearse conversations. |
| 2. Summarize and explain complex material
► Simplifies PDFs, legal docs, research, or code into plain English. | 7. Connect you to tools
► Write code for APIs, spreadsheets, calendars, or the web. |
| 3. Tutor you on nearly any subject
► Learn math, history, languages, or test prep, step by step. | 8. Offer therapy and companionship
► Talk through your day, reframe thoughts, or just listen. |
| 4. Be your thinking partner
► Brainstorm ideas, debug logic, or pressure-test assumptions. | 9. Help you find purpose
► Clarify values, define goals, and map actions that matter. |
| 5. Automate repetitive work
► Generate reports, clean data, outline slides, rewrite text. | 10. Organize your life
► Plan trips, build routines, structure your week or workflow. |

Source: ChatGPT (5/15/25)

AI =

Circa 2030?

Top Ten Things AI Will Likely Do in Five Years, per ChatGPT

ChatGPT 4o ▾

1. Generate human-level text, code & logic

► Chatbots, software engineering, business plans, legal analysis.

2. Create full-length films & games

► Scripts, characters, scenes, gameplay mechanics, voice acting.

3. Understand & speak like a human

► Emotionally aware assistants, real-time multilingual voice agents.

4. Power advanced personal assistants

► Life planning, memory recall, coordination across all apps and devices.

5. Operate humanlike robots

► Household helpers, elderly care, retail and hospitality automation.

6. Run autonomous customer service & sales

► End-to-end resolution, upselling, CRM integrations, 24/7 support.

7. Personalize entire digital lives

► Adaptive learning, dynamic content curation, individualized health coaching.

8. Build and run autonomous businesses

► AI-driven startups, inventory and pricing optimization, full digital operations.

9. Drive autonomous discovery in science

► Drug design, materials synthesis, climate modeling, novel hypothesis testing.

10. Collaborate creatively like a partner

► Co-writing novels, music production, fashion design, architecture.

AI =

Circa 2035?

Top Ten Things AI Will Likely Do in Ten Years, per ChatGPT

ChatGPT 4o ▾

1. Conduct scientific research

- Generate hypotheses, run simulations, design and analyze experiments.

2. Design advanced technologies

- Discover materials, engineer biotech, and prototype energy systems.

3. Simulate human-like minds

- Create digital personas with memory, emotion, and adaptive behavior.

4. Operate autonomous companies

- Manage R&D, finance, and logistics with minimal human input.

5. Perform complex physical tasks

- Handle tools, assemble components, and adapt in real-world spaces.

6. Coordinate systems globally

- Optimize logistics, energy use, and crisis response at scale.

7. Model full biological systems

- Simulate cells, genes, and organisms for research and therapy.

8. Offer expert-level decisions

- Deliver real-time legal, medical, and business advice.

9. Shape public debate and policy

- Moderate forums, propose laws, and balance competing interests.

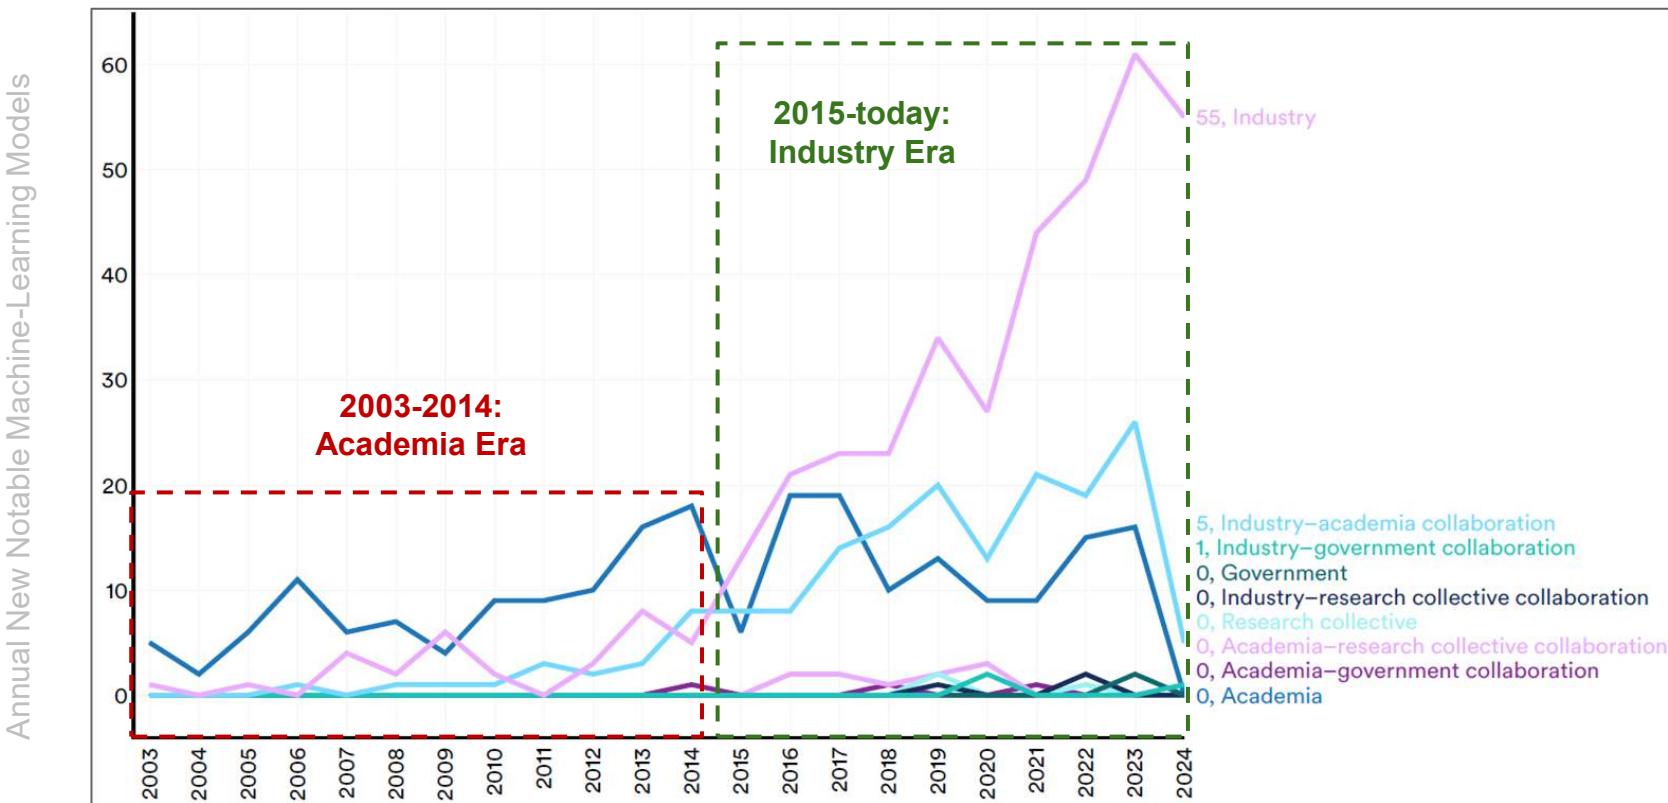

10. Build immersive virtual worlds

- Generate interactive 3D environments directly from text prompts.

AI Development Trending =
Unprecedented

Machine-Learning Model* Trending = In 2015... Industry Surpassed Academia as Data + Compute + Financial Needs Rose

Global Notable Machine Learning Models by Sector – 2003-2024, per Stanford HAI

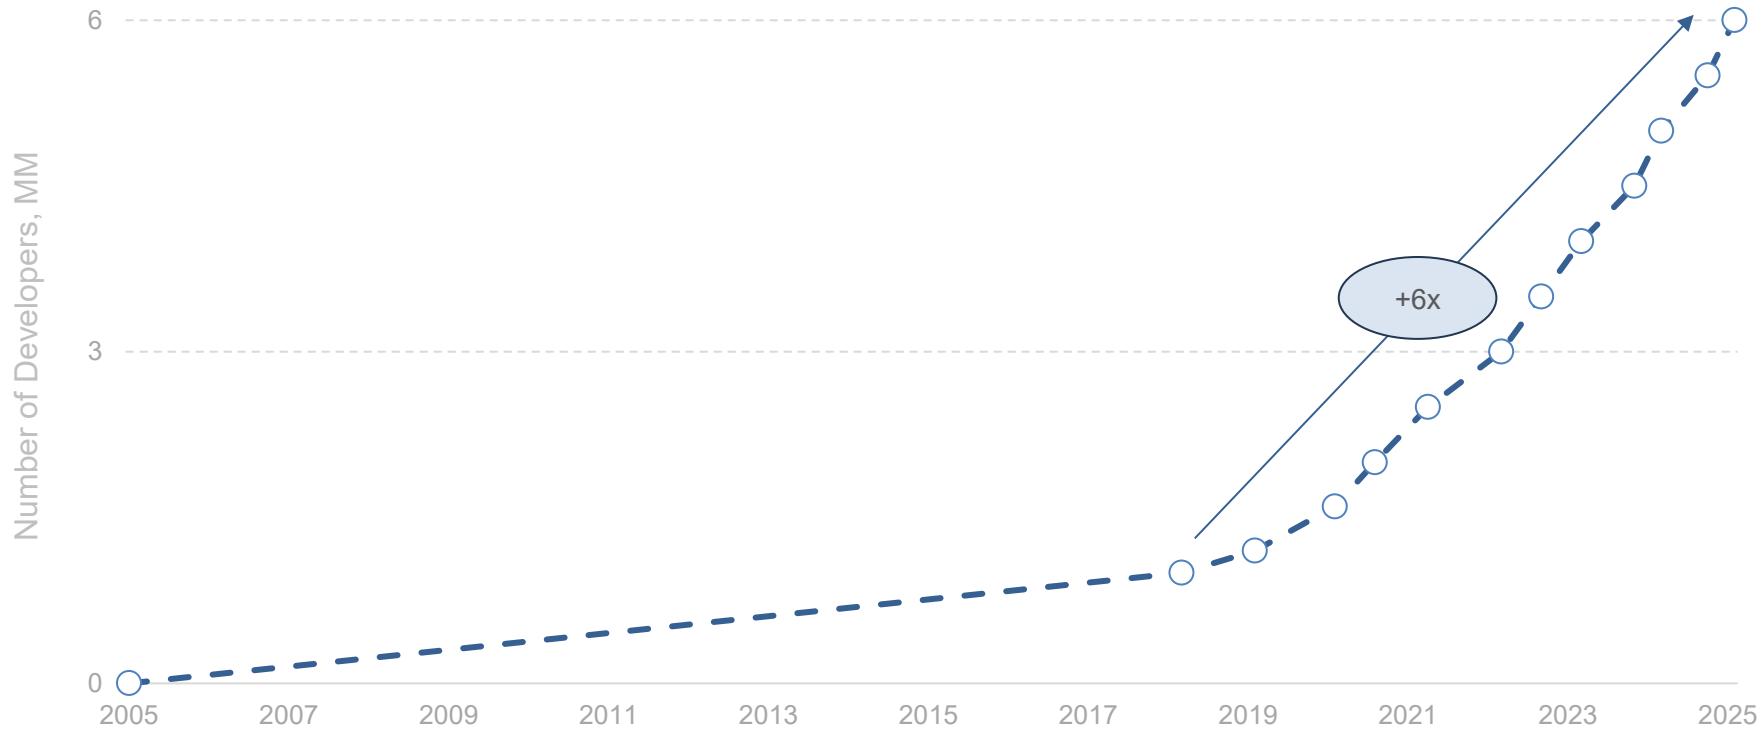

*Machine Learning = A subset of AI where machines learn from patterns in data without being explicitly programmed.

Note: Academia includes models developed by one or more institutions, including government agencies. Industry-academia collaboration excludes government partnerships and only captures partnerships between academic institutions and industry. Industry excludes models developed in partnership with any entity other than another company. Epoch AI, an AI Index data provider, uses the term 'notable machine learning models' to designate particularly influential models within the AI/machine learning ecosystem. Epoch maintains a database of 900 AI models released since the 1950s, selecting entries based on criteria such as state-of-the-art advancements, historical significance, or high citation rates. Since Epoch manually curates the data, some models considered notable by some may not be included. A count of zero academic models does not mean that no notable models were produced by academic institutions in 2023, but rather that Epoch AI has not identified any as notable. Additionally, academic publications often take longer to gain recognition, as highly cited papers introducing significant architectures may take years to achieve prominence. China data may be subject to informational limitations due to government restrictions. Source: Nestor Maslej et al., 'The AI Index 2025 Annual Report,' AI Index Steering Committee, Stanford HAI (4/25)

AI Developer Growth (NVIDIA Ecosystem as Proxy) = +6x to 6MM Developers Over Seven Years

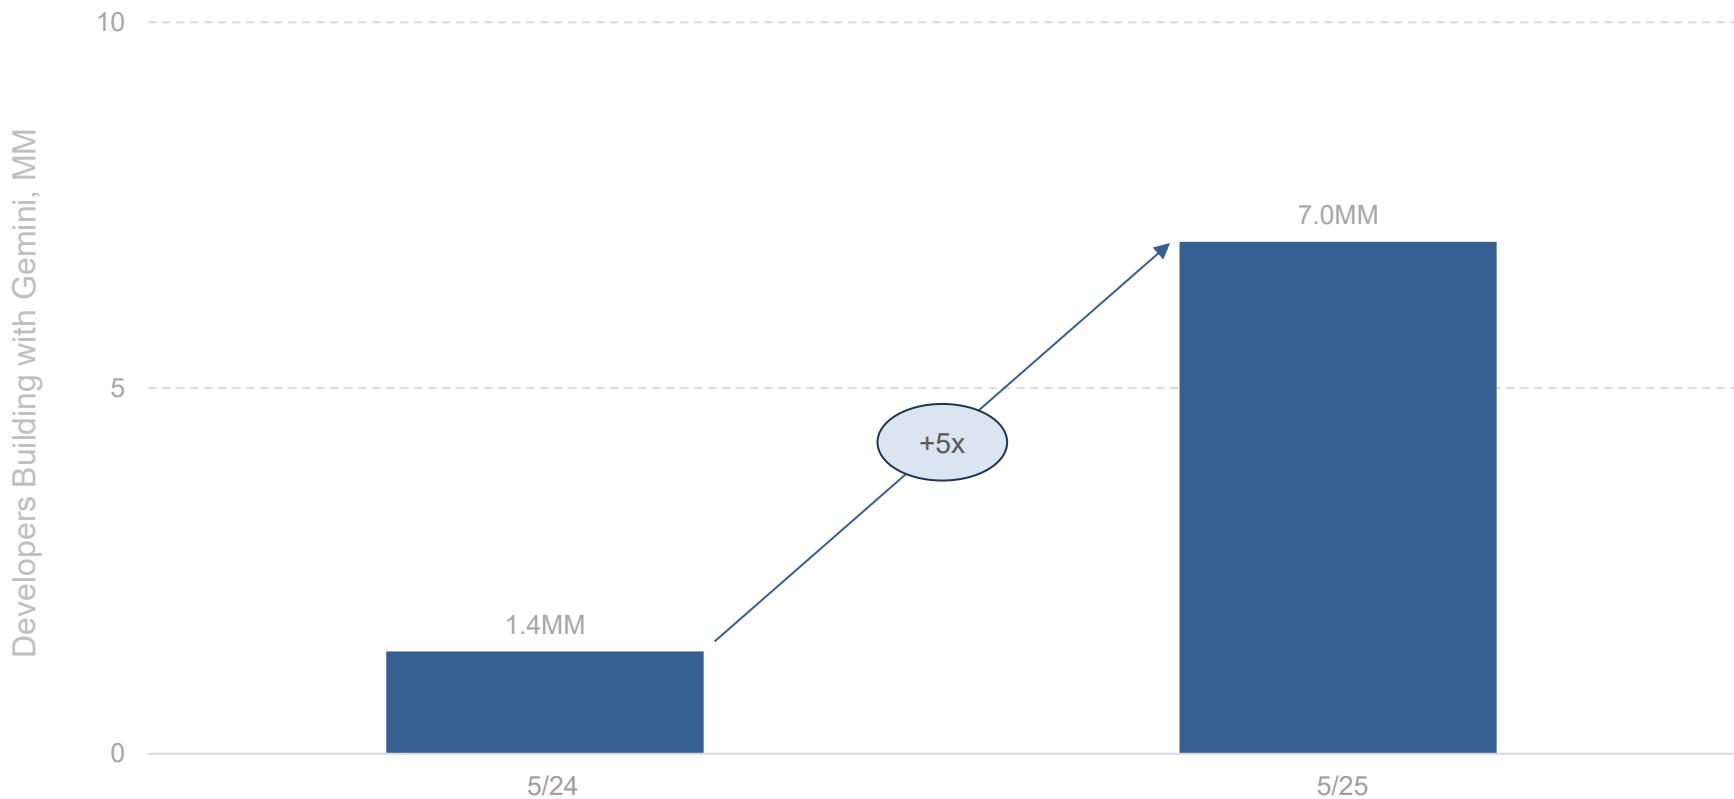

Global Developers in NVIDIA Ecosystem (MM) – 2005-2025, Per NVIDIA

Note: We assume negligible developers in NVIDIA's ecosystem in 2005 per this text from an 8/20 blog post titled '2 Million Registered Developers, Countless Breakthroughs': 'It took 13 years to reach 1 million registered developers, and less than two more to reach 2 million.' Source: NVIDIA blog posts, press releases, & company overviews

AI Developer Growth (Google Ecosystem as Proxy) = +5x to 7MM Developers Y/Y

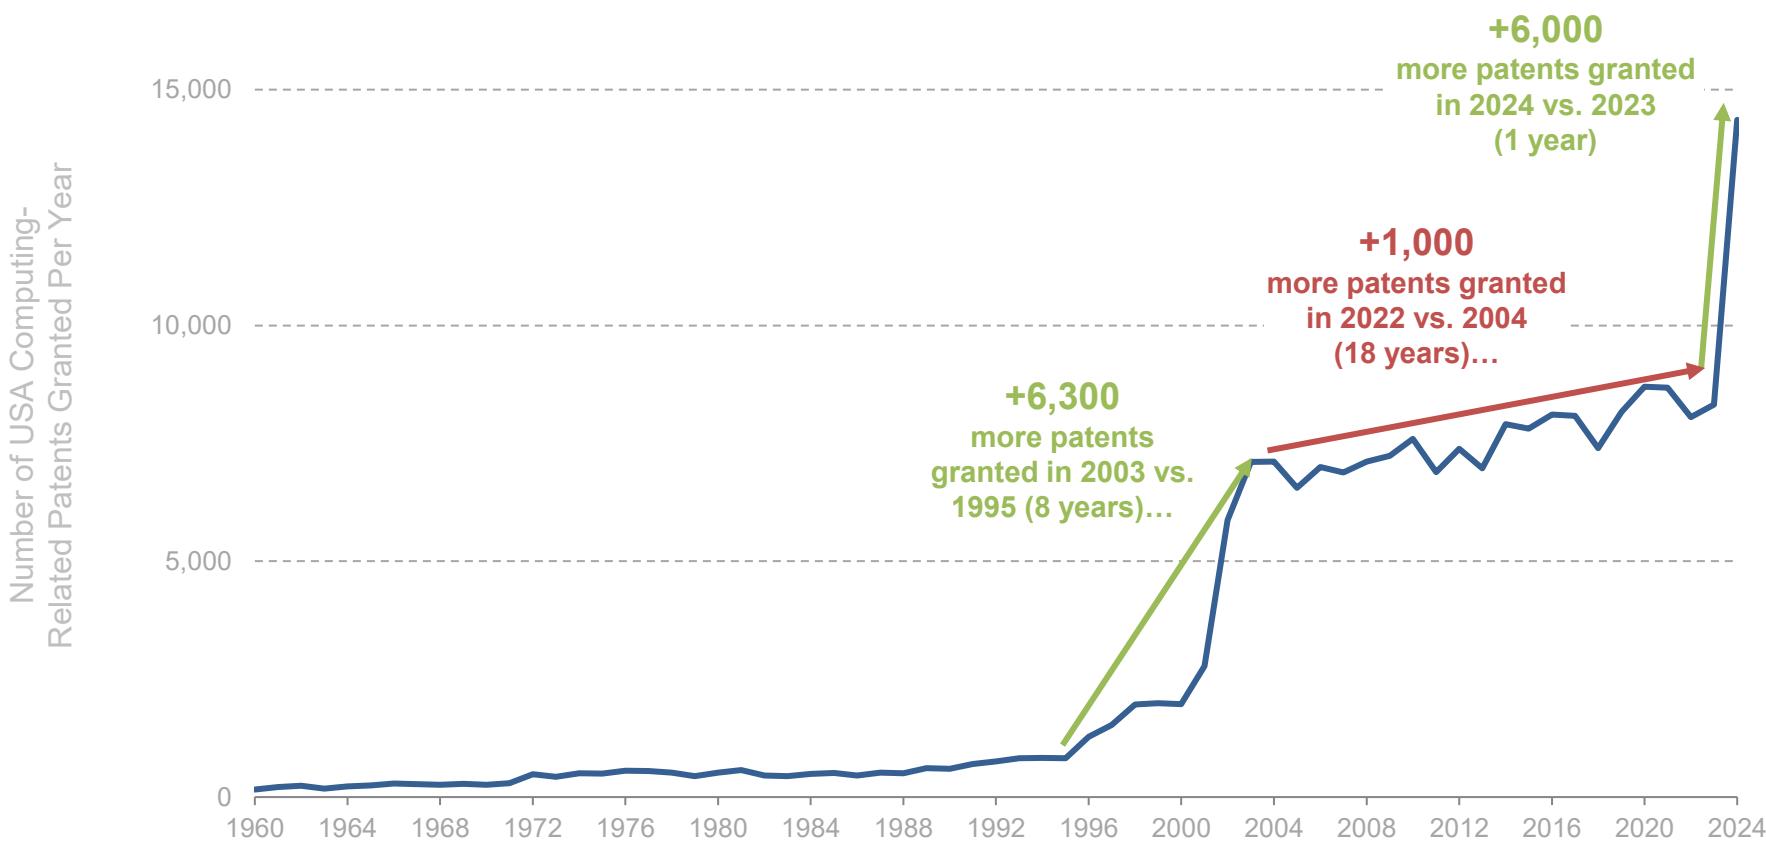

Estimated Global Developers in Google Ecosystem (MM) – 5/24-5/25, Per Google

Note: Per Google in 5/25, 'Over 7 million developers are building with Gemini, five times more than this time last year.' Source: Google, 'Google I/O 2025: From research to reality'
(5/25)

Computing-Related Patent Grants, USA = Exploded... Post-Netscape IPO (1995)...Again + Faster Post-ChatGPT Public Launch (2022)

USA Computing-Related* Patents Granted Annually – 1960-2024, per USPTO

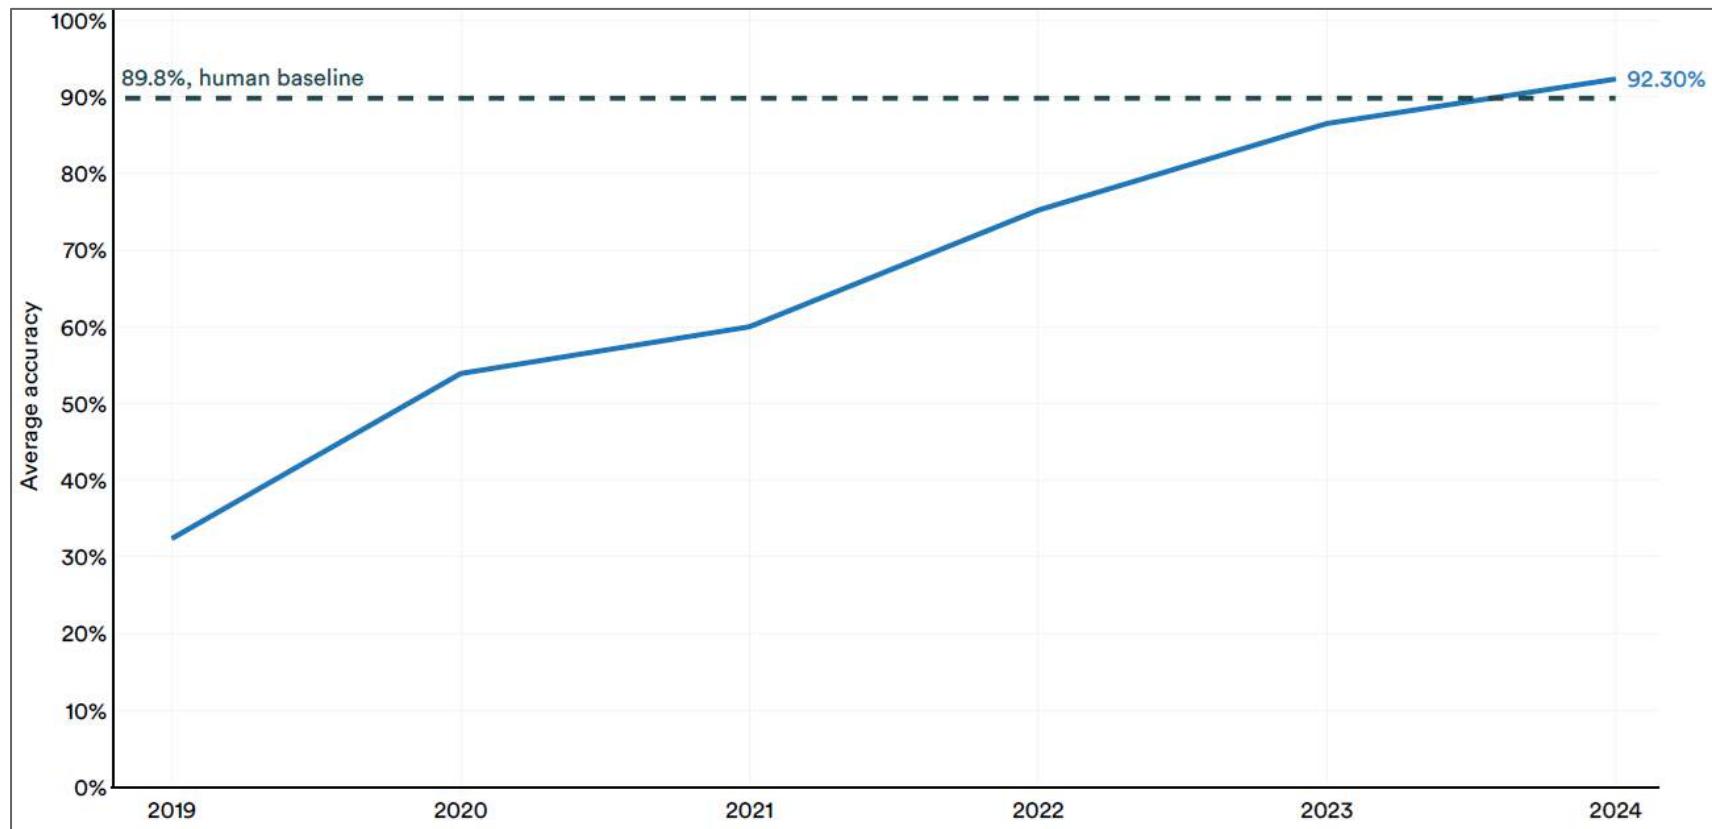

*Uses Cooperative Patent Classification (CPC) code G06, which corresponds to computing, calculating or counting patents. Google patents data changes somewhat between each query so numbers are rounded and should be viewed as directionally accurate. Source: USA Patent & Trademark Office (USPTO) via Google Patents (4/25)

AI Performance = In 2024...

Surpassed Human Levels of Accuracy & Realism, per Stanford HAI

AI System Performance on MMLU Benchmark Test – 2019-2024, per Stanford HAI

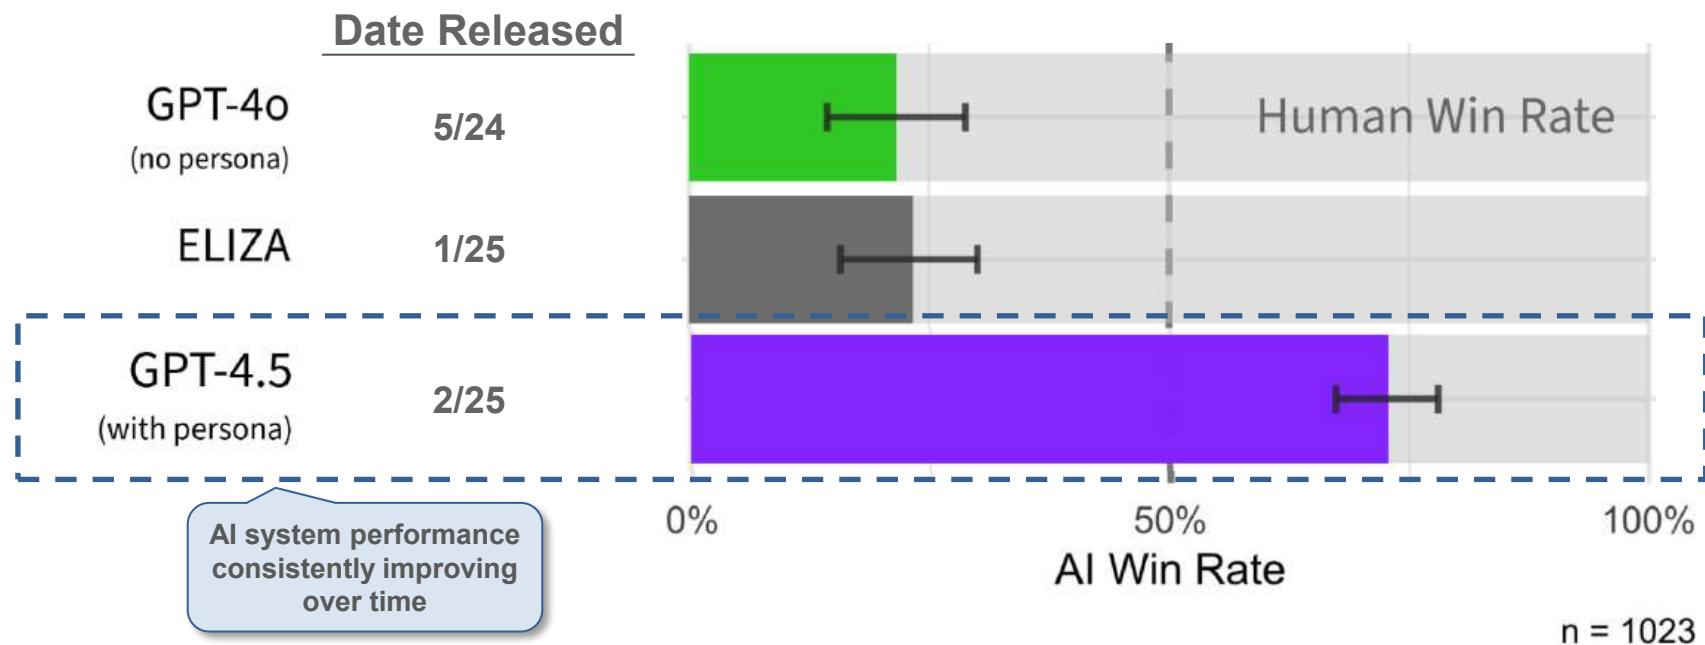

Note: The MMLU (Massive Multitask Language Understanding) benchmark evaluates a language model's performance across 57 academic and professional subjects, such as math, law, medicine, and history. It measures both factual recall and reasoning ability, making it a standard for assessing general knowledge and problem-solving in large language models. 89.8% is the generally-accepted benchmark for human performance. Stats above show average accuracy of top-performing AI models in each calendar year. Source: Papers With Code via Nestor Maslej et al., 'The AI Index 2025 Annual Report,' AI Index Steering Committee, Stanford HAI (4/25)

AI Performance = In Q1:25...

73% of Responses & Rising Mistaken as Human by Testers

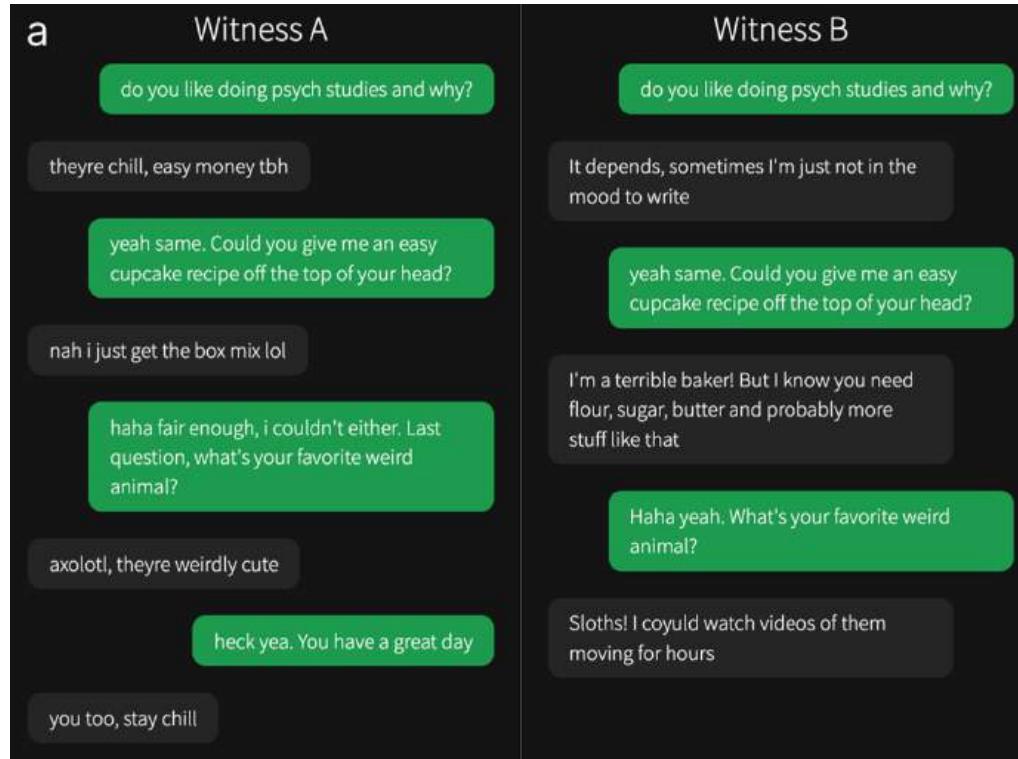

**% of Testers Who Mistake AI Responses as Human-Generated – 3/25,
per Cameron Jones / Benjamin Bergen**

Note: The Turing test, introduced in 1950, measures a machine's ability to mimic human conversation. In this study, ~500 participants engaged in a three-party test format, interacting with both a human and an AI. Most discussions leaned on emotional resonance and day-to-day topics over factual knowledge. Eliza was developed in the mid-1960s by MIT professor Joseph Weizenbaum. It is considered the world's first chatbot. In January 2025, researchers successfully revived Eliza using its original code. Source: Cameron Jones and Benjamin Bergen, 'Large Language Models Pass the Turing Test' (3/25) via UC San Diego

AI Performance = Increasingly Realistic Conversations Simulating Human Behaviors

Turing Test Conversation with GPT-4.5 – 3/25, per Cameron Jones / Benjamin Bergen

What Was Tested:

The Turing Test is a concept introduced by Alan Turing in 1950 to evaluate a machine's ability to exhibit intelligent behavior indistinguishable from that of a human. In the test, if a human evaluator cannot reliably tell whether responses are coming from a human or a machine during a conversation, the machine is said to have passed. Here, participants had to guess whether Witness A or Witness B was an AI system.

Results:

The conversation on the left is an example Turing Test carried out in 3/25 using GPT-4.5. During the test, participants **incorrectly** identified the left image (Witness A) as human with 87% certainty, saying 'A had human vibes. B had human imitation vibes.' **A was actually AI-generated; B was human.**

Source: Cameron Jones and Benjamin Bergen, 'Large Language Models Pass the Turing Test' (3/25) via UC San Diego

AI Performance = Increasingly Realistic Image Generation...

**AI-Generated Image: 'Women's Necklace with a Sunflower Pendant' – 2/22-4/25,
per Midjourney / Gold Penguin**

Model v1 (2/22)

Model v7 (4/25)

Notes: Dates shown are the release dates of each Midjourney model. Source: Midjourney (4/25) & Gold Penguin, 'How Midjourney Evolved Over Time (Comparing V1 to V6.1 Outputs)' (9/24)

...AI Performance = Increasingly Realistic Image Generation

AI-Generated vs. Real Image – 2024

AI-Generated Image (2024)

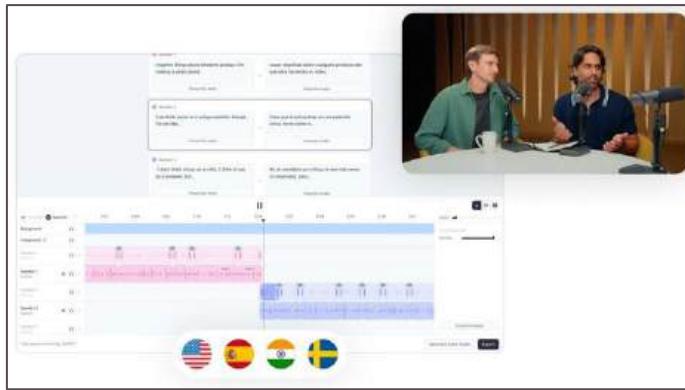

Real Image

Source: Left – StyleGAN2 via 'The New York Times,' 'Test Yourself: Which Faces Were Made by A.I.?' (1/24); Right – Creative Commons

AI Performance = Increasingly Realistic Audio Translation / Generation...

ElevenLabs AI Voice Generator – 1/23-4/25, per ElevenLabs & Similarweb

When you create a new dubbing project, Dubbing Studio automatically transcribes your content, translates it into the new language, and generates a new audio track in that language. Each speaker's original voice is isolated and cloned before generating the translation to make sure they sound the same in every language.

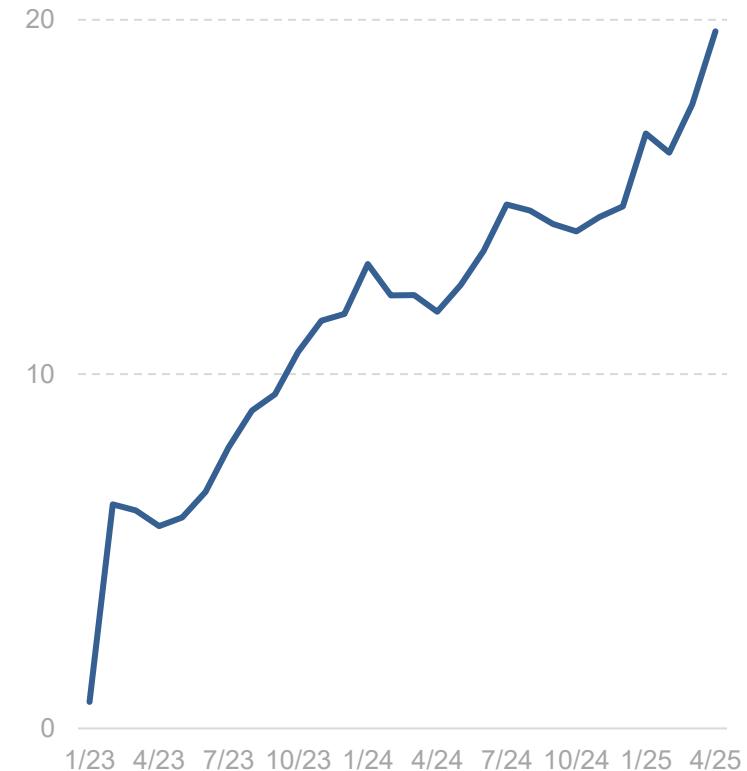

- ElevenLabs Press Release, 1/24

In just two years, ElevenLabs' millions of users have generated 1,000 years of audio content and the company's tools have been adopted by employees at over 60% of Fortune 500 companies.

- ElevenLabs Press Release, 1/25

Note: China data may be subject to informational limitations due to government restrictions.
Source: ElevenLabs (1/24 & 1/25), Similarweb (5/25)

**ElevenLabs Monthly Global Site Visits (MM),
per Similarweb – 1/23-4/25**

...AI Performance = Evolving to Mainstream Realistic Audio Translation / Generation

AI-Powered Audio Translation – 5/25, per Spotify

2/25:

Spotify begins accepting audiobooks AI-translated into 29 languages from ElevenLabs

Imagine if you're a creator and you're the world expert at something...but you happen to be Indonesian. Today, there's a language barrier and it will be very hard if you don't know English to be able to get to a world stage.

But with AI, it might be possible in the future where you speak in your native language, and the AI will understand it and will actually real-time translate...

*...What will that do for creativity? For knowledge sharing? For entertainment?
I think we're in the very early innings of figuring that out...*

...We want Spotify to be the place for all voices.

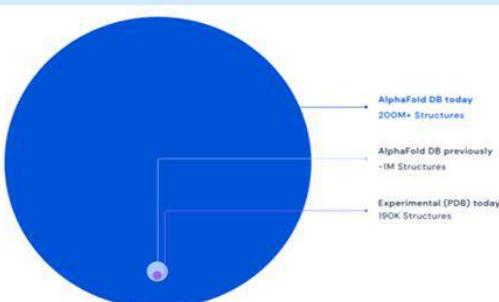

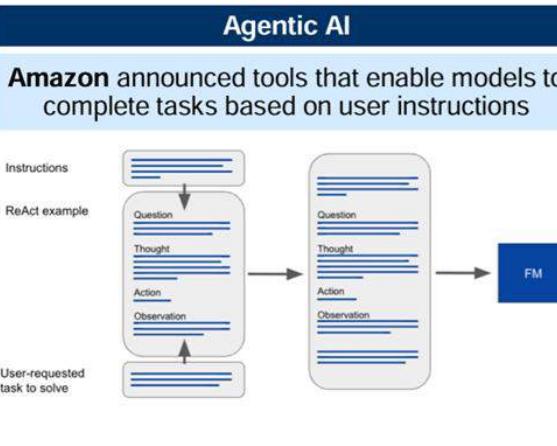

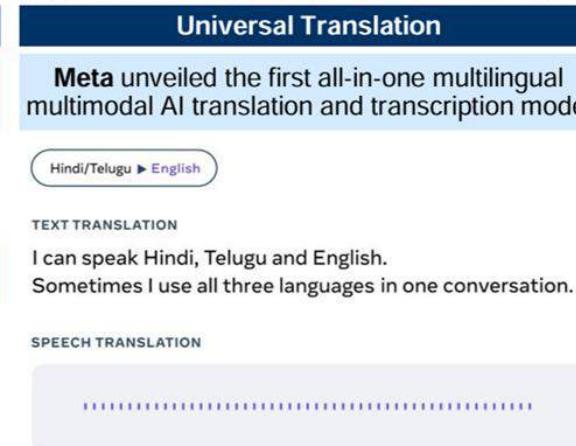

- Spotify Co-Founder & CEO Daniel Ek (5/25)

In Q1:25, Spotify had 678MM Monthly Active Users and 268MM Subscribers and supported €16.8B in annualized revenue while hosting 100MM+ tracks, ~7MM podcast titles and ~1MM creative artists.

Note: Revenue annualized using Q1:25 results. Source: Spotify, 'The New York Post,' 'Inside Spotify: CEO Daniel Ek on AI, Free Speech & the Future of Music' (5/25); Spotify earnings releases; eMarketer, 'Spotify dominates Apple and Amazon in digital audio' (4/25)

AI Performance = Emerging Applications Accelerating

Emerging AI Applications – 11/24, per Morgan Stanley

<p>Protein Folding</p> <p>DeepMind's AlphaFold can predict the structure of nearly all known proteins</p> 	<p>Cancer Detection</p> <p>Microsoft & Paige are building the world's largest image-based AI model to Fight Cancer</p> 	<p>Robotics</p> <p>Google demonstrates that robots can understand and act on human instruction using LLMs</p>

Benefits & Risks

AI Development = Benefits & Risks

The widely-discussed benefits and risks of AI – top-of-mind for many – generate warranted excitement *and* trepidation, further fueled by uncertainty over the rapid pace of change and intensifying global competition and saber rattling.

The pros Stuart Russell and Peter Norvig went deep on these topics in the Fourth Edition (2020) of their 1,116-page classic 'Artificial Intelligence: A Modern Approach' ([link here](#)), and their views still hold true.

Highlights follow...

...the benefits: put simply, our entire civilization is the product of our human intelligence. If we have access to substantially greater machine intelligence, the [ceiling of our] ambitions is raised substantially.

The potential for AI and robotics to free humanity from menial repetitive work and to dramatically increase the production of goods and services could presage an era of peace and plenty.

The capacity to accelerate scientific research could result in cures for disease and solutions for climate change and resource shortages.

As Demis Hassabis, CEO of Google DeepMind, has suggested: 'First we solve AI, then use AI to solve everything else.' Long before we have an opportunity to 'solve AI,' however, we will incur risks from the misuse of AI, inadvertent or otherwise.

Some of these are already apparent, while others seem likely based on current trends including lethal autonomous weapons...surveillance and persuasion...biased decision making... impact on employment...safety-critical applications...cybersecurity...

Success in creating AI could be the biggest event in the history of our civilization. But it could also be the last – unless we learn how to avoid the risks.

Stephen Hawking, Theoretical Physicist / Cosmologist (1942-2018)

Outline

- 1 Seem Like Change Happening Faster Than Ever?
Yes, It Is

Tech Incumbent AI Adoption =
Top Priority

Tech Incumbent AI Focus = Talking-the-Talk...

Mentions of 'AI' in Corporate Earnings Transcripts – Q1:20-Q1:24, per Uptrends

Source: Uptrends, 'Top 15 Companies Mentioning AI on Earnings Calls' (6/24), company earnings transcripts

...Tech Incumbent AI Focus = Talking-the-Talk...

Generative AI is going to reinvent virtually every customer experience we know and enable altogether new ones about which we've only fantasized. The early AI workloads being deployed focus on productivity and cost avoidance...

...Increasingly, you'll see AI change the norms in coding, search, shopping, personal assistants, primary care, cancer and drug research, biology, robotics, space, financial services, neighborhood networks – everything.

- Amazon CEO Andy Jassy in 2024 Amazon Shareholder Letter – 4/25

The chance to improve lives and reimagine things is why Google has been investing in AI for more than a decade...

...We see it as the most important way we can advance our mission to organize the world's information, make it universally accessible and useful...

...The opportunity with AI is as big as it gets.

- Google CEO Sundar Pichai @ Google Cloud Next 2025 – 4/25

...Tech Incumbent AI Focus = Talking-the-Talk...

AI Going Full-Circle:
DeepMind's AlphaGo (2014) started with humans training machines...Duolingo Chess now has machines training humans...

There's three places where [GenAI is]...helping us: data creation...creating new features that were just not possible... efficiencies everywhere in the company...

...I should mention something amazing about [the new Duolingo curriculum in] chess is that it really started with a team of two people, neither of whom knew how to program...and they basically made prototypes and did the whole curriculum of chess by just using AI. Also, neither of them knew how to play chess.

- Duolingo Co-Founder & CEO Luis von Ahn @ Q1:25 Earnings Call – 5/25

AI with Grok is getting very good...it's important that AI be programmed with good values, especially truth-seeking values. This is, I think, essential for AI safety...

...Remember these words: We must have a maximally truth-seeking AI.

- xAI Founder & CEO Elon Musk – 5/25

Note: On 3/28/25, Elon Musk announced that xAI had acquired X in an all-stock deal. The deal valued xAI at \$80B and X at \$33B (\$45B less \$12B debt). Source: Duolingo (5/1/25), DeepMind, Elon Musk (5/2/25), Fox News

...Tech Incumbent AI Focus = Talking-the-Talk

*We view AI as a human acceleration tool that will allow individuals to do more...
I believe long term, we will see people coupled with...
the AI they use as the overall output of that person.*

**- Roblox Co-Founder, President, CEO & Chair of Board David Baszucki
@ Q1:25 Earnings Call – 5/25**

I promise you, in ten years' time, you will look back and you will realize that AI has now integrated into everything. And in fact, we need AI everywhere.

*And every region, every industry, every country, every company, all needs AI.
AI [is] now part of infrastructure. And this infrastructure,
just like the internet, just like electricity, needs factories....*

*...And these AI data centers, if you will, are improperly described. They are, in fact,
AI factories. You apply energy to it, and it produces something incredibly valuable.*

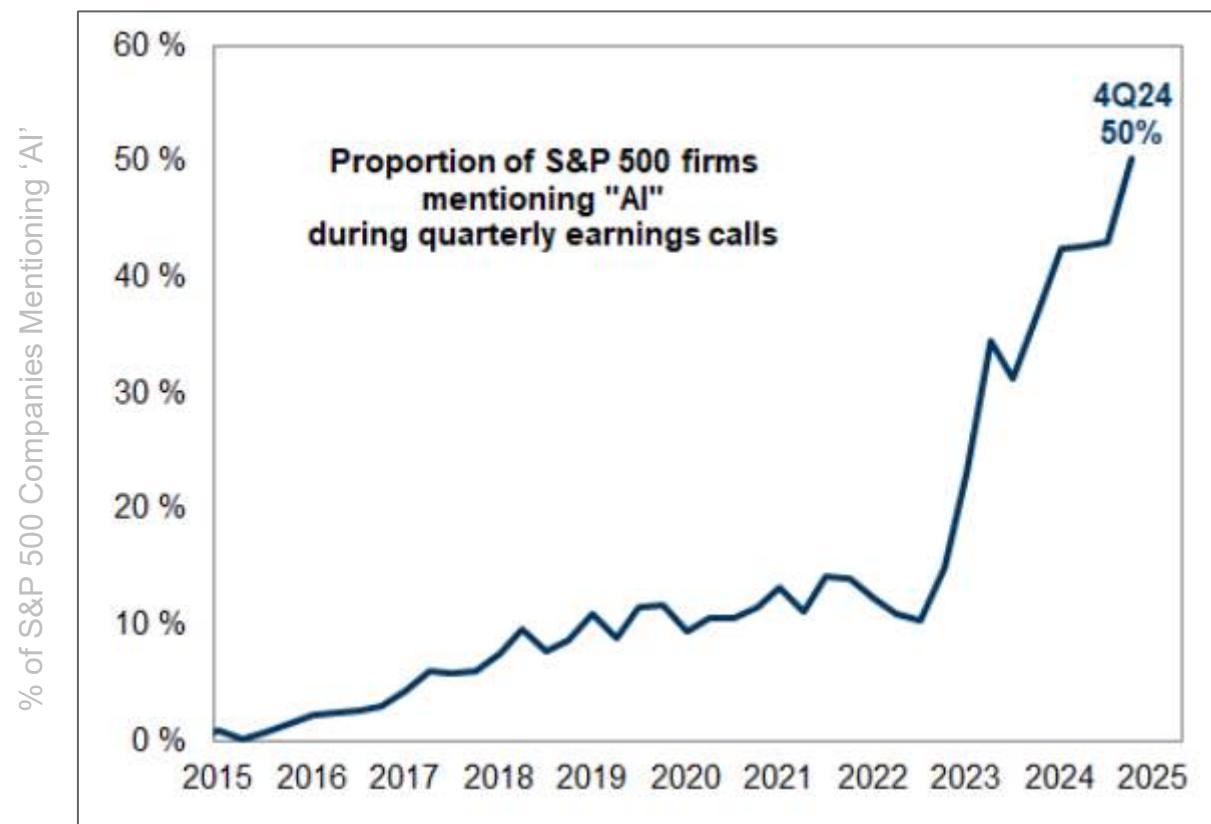

**- NVIDIA Co-Founder & CEO Jensen Huang

Enterprise AI Adoption = Rising Priority...

Kaiser Permanente – Multimodal Ambient AI Scribe (10/23)

Kaiser Permanente Ambient AI Scribe – 10/23-12/24, per New England Journal of Medicine

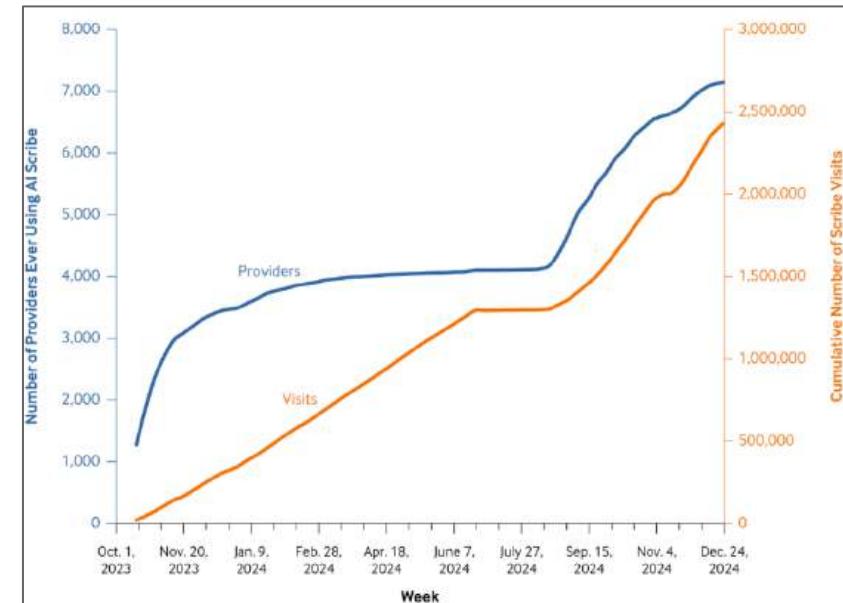

The screenshot shows a news article from the Kaiser Permanente website. The headline reads "Kaiser Permanente improves member experience with AI-enabled clinical technology". Below the headline, a sub-headline states: "Assisted clinical documentation tool from Abridge helps doctors reduce time spent on administrative tasks, allowing them to be more present with patients." A press release from October 16, 2023, is also visible, detailing the implementation of the Abridge AI scribe tool across Kaiser Permanente's 10,000 physician and staff members.

Ambient artificial intelligence (AI) scribes, which use machine learning applied to conversations to facilitate scribe-like capabilities in real time, [have] great potential to reduce documentation burden, enhance physician-patient encounters, and augment clinicians' capabilities.

The technology leverages a smartphone microphone to transcribe encounters as they occur but does not retain audio recordings. To address the urgent and growing burden of data entry, in October 2023, The Permanente Medical Group (TPMG) enabled ambient AI technology for 10,000 physicians and staff to augment their clinical capabilities across diverse settings and specialties.

Yum! Brands – Byte by Yum! (2/25)

Yum! Brands Byte by Yum! – 2/24-2/25, per Yum! Brands

Byte is Yum! Brands' AI-powered restaurant management platform designed to optimize store operations by automating repetitive tasks like inventory tracking, scheduling, and food preparation alerts. It leverages machine learning to improve decision-making at the restaurant level, enhancing efficiency, reducing waste, and supporting staff productivity.

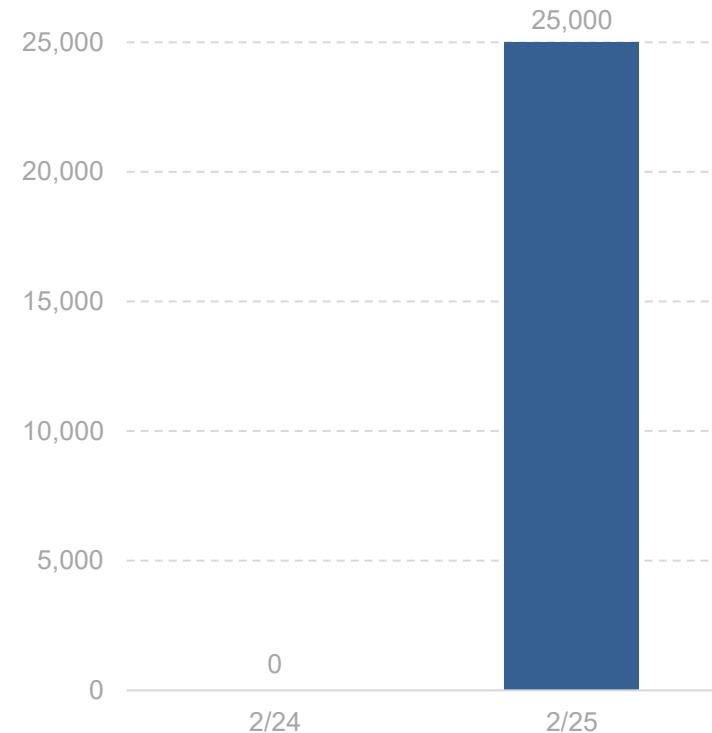

Backed by artificial intelligence, Byte by Yum! offers franchisees leading technology capabilities with advantaged economics made possible by the scale of Yum!.

The Byte by Yum! platform includes online and mobile app ordering, point of sale, kitchen and delivery optimization, menu management, inventory and labor management, and team member tools.

- Yum! Press Release, 2/25

Note: Yum! Brands names include KFC, Taco Bell, Pizza Hut, & The Habit. Byte by Yum! was officially launched in 2/25. While underlying technologies were previously in-use at restaurants in Yum!s portfolio, the Byte by Yum! product suite had not yet officially been launched; hence, we illustratively show zero users in 2/24. Source: Yum!, 'Introducing Byte by Yum!™, an AI-driven restaurant technology platform powering customer and team member experiences worldwide'(2/25)

Arizona State University's 'AI Acceleration' – 8/23

New team of technologists creating artificial intelligence (AI) tools

ASU unveils first-of-its-kind organization to advance AI across the enterprise

August 2, 2023

Recognized as the nation's most innovative university by U.S. News and World Report for eight years and counting, ASU is at the forefront of cutting-edge technology in advancing research and the pathway of health and innovation. ASU's Enterprise Technology University Society is the catalyst of AI Acceleration, a new team of technologists dedicated to creating the next generation of artificial intelligence (AI) tools.

The group is charged with providing positive outcomes for students, paving new pathways for groundbreaking research, and developing the technical infrastructure for more efficient business operations.

AI Acceleration is part of a larger initiative being led by ASU's Enterprise Technology to drive strategy across the university that involves all students, faculty, and staff to leverage the advantages of AI in every facet of daily work.

Under the leadership of Executive Director Elizabeth Reiley and AI Technology Director Zane Zell, AI Acceleration brings together a team of 10 people working on machine learning, natural language processing, data integration, and AI development to drive the development of AI products and services.

"Our goal is to develop AI platforms and provide the necessary tools to the needs of students and society," says Reiley. "The opportunities are staggering. AI technology is moving across the university, and we are excited to work with tools that improve the accessibility, affordability and personalization of higher education."

Work under the AI Acceleration team is already underway. For example, a new platform is being developed that provides integration of AI technology to teams across the university. The platform will support a variety of applications, including AI-powered research, AI-powered learning, natural language models, natural language processing (NLP), predictive modeling and more. — *Important* at their knowledge of software development. By leveraging these resources, the university can make informed decisions that have a positive impact on research, operations, and student experience.

Oxford Partnership – 3/25

5-Year Partnership on Research & AI Literacy

Oxford and OpenAI launch collaboration to advance research and education

14 March 2023

OXFORD, U.K. — The University of Oxford and OpenAI have announced a five-year strategic partnership to advance research and education in artificial intelligence (AI).

The University of Oxford has announced plans to expand its artificial intelligence (AI) offering and capabilities with OpenAI.

NextGenAI – 3/25

\$50MM consortium with 15 research universities (MIT, Harvard, Caltech, etc.)

AI Usage Expansion – Deep Research = Automating Specialized Knowledge Work

Select AI Company Deep Research Capabilities – 12/24-2/25, per Google, OpenAI & xAI

Google Gemini Deep Research

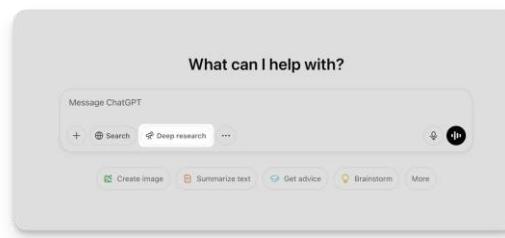

Get up to speed on just about anything with Deep Research, an agentic feature in Gemini that can automatically browse up to hundreds of websites on your behalf, think through its findings, and create insightful multi-page, reports that you can turn into engaging podcast-style conversations...

...It's a step towards more agentic AI that can move beyond simple question-answering to become a true collaborative partner.

- Google Deep Research Overview, launched 12/24

OpenAI ChatGPT

Deep Research

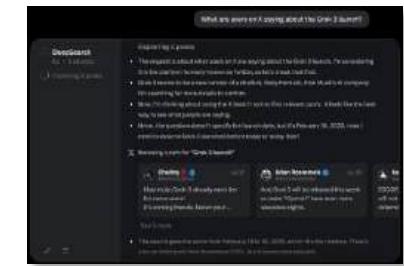

Today we're launching deep research in ChatGPT, a new agentic capability that conducts multi-step research on the internet for complex tasks.

It accomplishes in tens of minutes what would take a human many hours...

...Deep research marks a significant step toward our broader goal of developing AGI, which we have long envisioned as capable of producing novel scientific research.

- OpenAI Deep Research
Press Release, 2/25

xAI Grok
DeepSearch

To understand the universe, we must interface Grok with the world...

...As a first step towards this vision, we are rolling out DeepSearch – our first agent.

It's a lightning-fast AI agent built to relentlessly seek the truth across the entire corpus of human knowledge. DeepSearch is designed to synthesize key information, reason about conflicting facts and opinions, and distill clarity from complexity.

- xAI Grok 3 Beta Press Release, 2/25

Source: Google (5/25), OpenAI (2/25), xAI (2/25), Digital Trends (1/25)

AI Agent Evolution =
Chat Responses → Doing Work

A new class of AI is now emerging – less assistant, more service provider.

What began as basic conversational interfaces may now be evolving into something far more capable.

Traditional chatbots were designed to respond to user prompts, often within rigid scripts or narrow flows. They could fetch answers, summarize text, or mimic conversation – but always in a reactive, limited frame.

AI agents represent a step-change forward. These are intelligent long-running processes that can reason, act, and complete multi-step tasks on a user's behalf. They don't just answer questions – they execute: booking meetings, submitting reports, logging into tools, or orchestrating workflows across platforms, often using natural language as their command layer.

This shift mirrors a broader historical pattern in technology.

Just as the early 2000s saw static websites give way to dynamic web applications – where tools like Gmail and Google Maps transformed the internet from a collection of pages into a set of utilities – AI agents are turning conversational interfaces into functional infrastructure.

Whereas early assistants needed clear inputs and produced narrow outputs, agents promise to operate with goals, autonomy and certain guardrails. They promise to interpret intent, manage memory, and coordinate across apps to get real work done. It's less about responding and more about accomplishing.

While we are early in the development of these agents, the implications are just starting to emerge.

AI agents could reshape how users interact with digital systems – from customer support and onboarding to research, scheduling, and internal operations.

Enterprises are leading the charge; they're not just experimenting with agents, but deploying them, investing in frameworks and building ecosystems around autonomous execution.

What was once a messaging interface is becoming an action layer.

AI Agent Interest (Google Searches) = +1,088% Over Sixteen Months

Next Frontier For AI =
Artificial General Intelligence

Artificial General Intelligence, or AGI, refers to systems capable of performing the full range of human intellectual tasks – reasoning, planning, learning from small data samples, and generalizing knowledge across domains.

Unlike current AI models, which excel within specific (albeit broad) boundaries, AGI would be able to operate fully flexibly across disciplines and solve unfamiliar problems without retraining.

It represents a major milestone in AI development – one that builds on recent exponential gains in model scale, training data, and computational efficiency.

Timelines for AGI remain uncertain, but expert expectations have shifted forward meaningfully in recent years. Sam Altman, CEO of OpenAI, remarked in January 2025, *We are now confident we know how to build AGI as we have traditionally understood it.* This is a forecast, not a dictum, but it reflects how advances in model architecture, inference* efficiency, and training scale are shortening the distance between research and frontier capability.

The broader thread is clear: AI development is trending at unprecedented speed, and AGI is increasingly being viewed not as a hypothetical endpoint, but as a reachable threshold.

If / when achieved, AGI would redefine what software (and related hardware) can do. Rather than executing pre-programmed tasks, AGI systems would understand goals, generate plans, and self-correct in real time. They could drive research, engineering, education, and logistics workflows with little to no human oversight – handling ambiguity and novelty with general-purpose reasoning. These systems wouldn't require extensive retraining to handle new problem domains – they would transfer learning and operate with context, much like human experts. Additionally, humanoid robots powered by AGI would have the power to reshape our physical environment and how we operate in it.

Still, the implications warrant a measured view. AGI is not a finish line, but a phase shift in capability – and how it reshapes institutions, labor, and decision-making will depend on the safeguards and deployment frameworks that accompany it. The productivity upside may be significant, but unevenly distributed.

The geopolitical, ethical, and economic implications may evolve gradually, not abruptly. As with earlier transitions – from industrial to digital to algorithmic – the full consequences will be shaped not just by what the technology can do, but by how society chooses to adopt and govern it.

*Inference = Fully-trained model generates predictions, answers, or content in response to user inputs. This phase is much faster and more efficient than training.

AI User + Usage + CapEx Growth =

Unprecedented

To understand where technology CapEx is heading, it helps to look at where it's been.

Over the past two decades, tech CapEx has flexed upward at points through data's long arc – first toward storage / access, then toward distribution / scale, and now toward computation / intelligence.

The earliest wave saw CapEx pouring into building internet infrastructure – massive server farms, undersea cables, and early data centers that enabled Amazon, Microsoft, Google and others to lay the foundation for cloud computing. That was the first phase: store it, organize it, serve it.

The second wave – still unfolding – has been about supercharging compute for data-heavy AI workloads, a natural evolution of cloud computing. Hyperscaler* CapEx budgets now tilt increasingly toward specialized chips (GPUs, TPUs, AI accelerators...), liquid cooling, and frontier data center design.

In 2019, AI was a research feature; by 2023, it was a capital expenditure line item.

Microsoft Vice Chair and President Brad Smith put it well in a 4/25 blog post:

Like electricity and other general-purpose technologies in the past, AI and cloud datacenters represent the next stage of industrialization.

The world's biggest tech companies are spending tens of billions annually – not just to gather data, but to learn from it, reason with it and monetize it in real time. It's still about data – but now, the advantage goes to those who can train on it fastest, personalize it deepest, and deploy it widest.

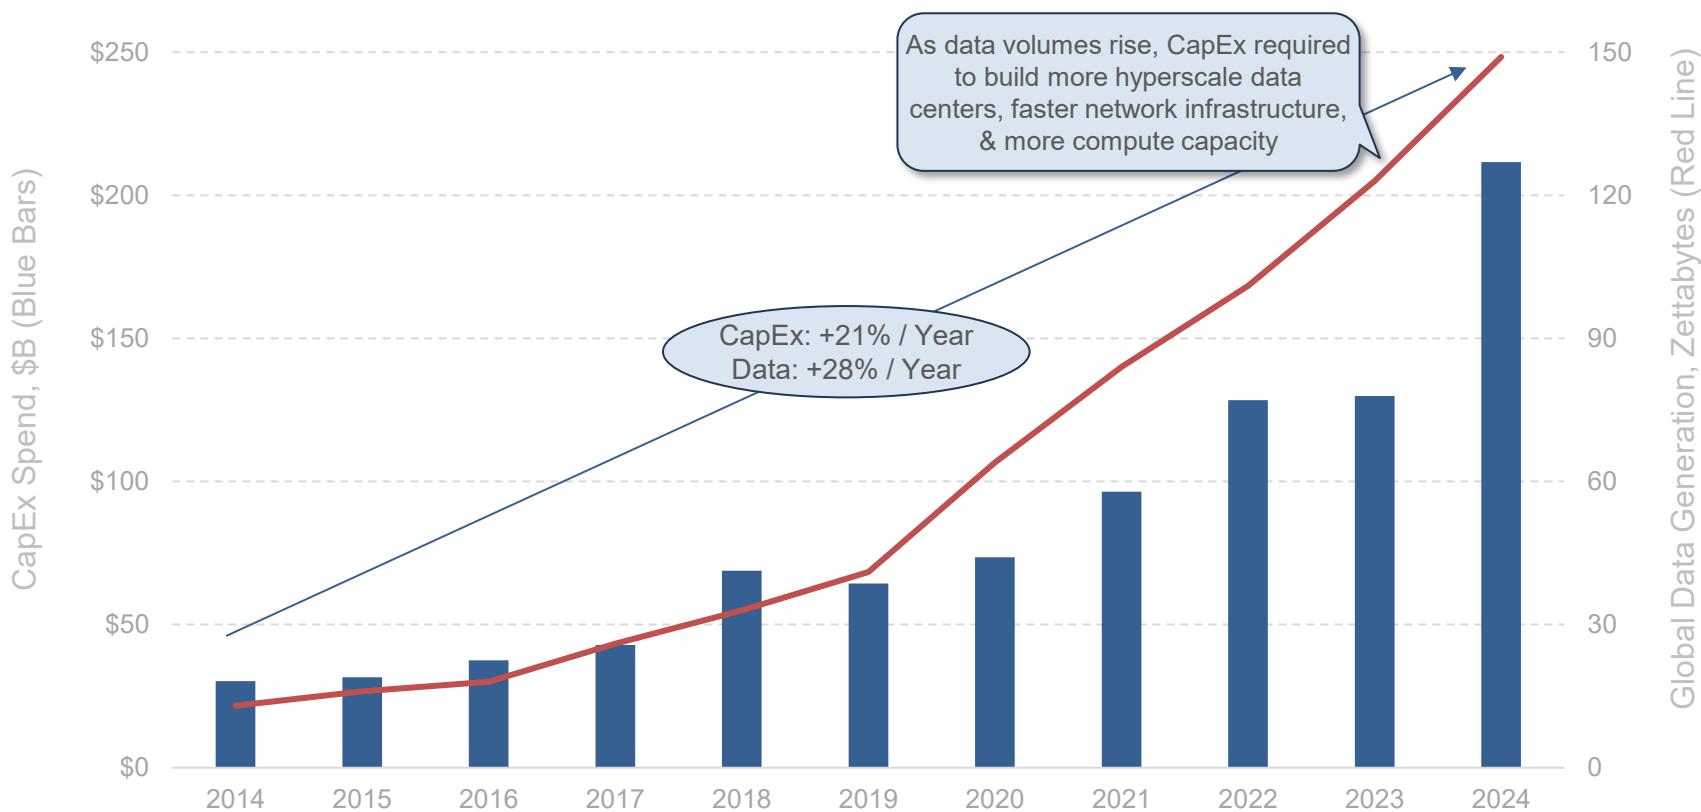

*Hyperscalers (large data center operators) are Amazon Web Services (AWS), Microsoft Azure, Google Cloud Platform (GCP), Alibaba Cloud, Oracle Cloud Infrastructure (OCI), IBM Cloud & Tencent Cloud.

CapEx Spend – Big Technology Companies =

On Rise for Years as
Data Use + Storage Exploded

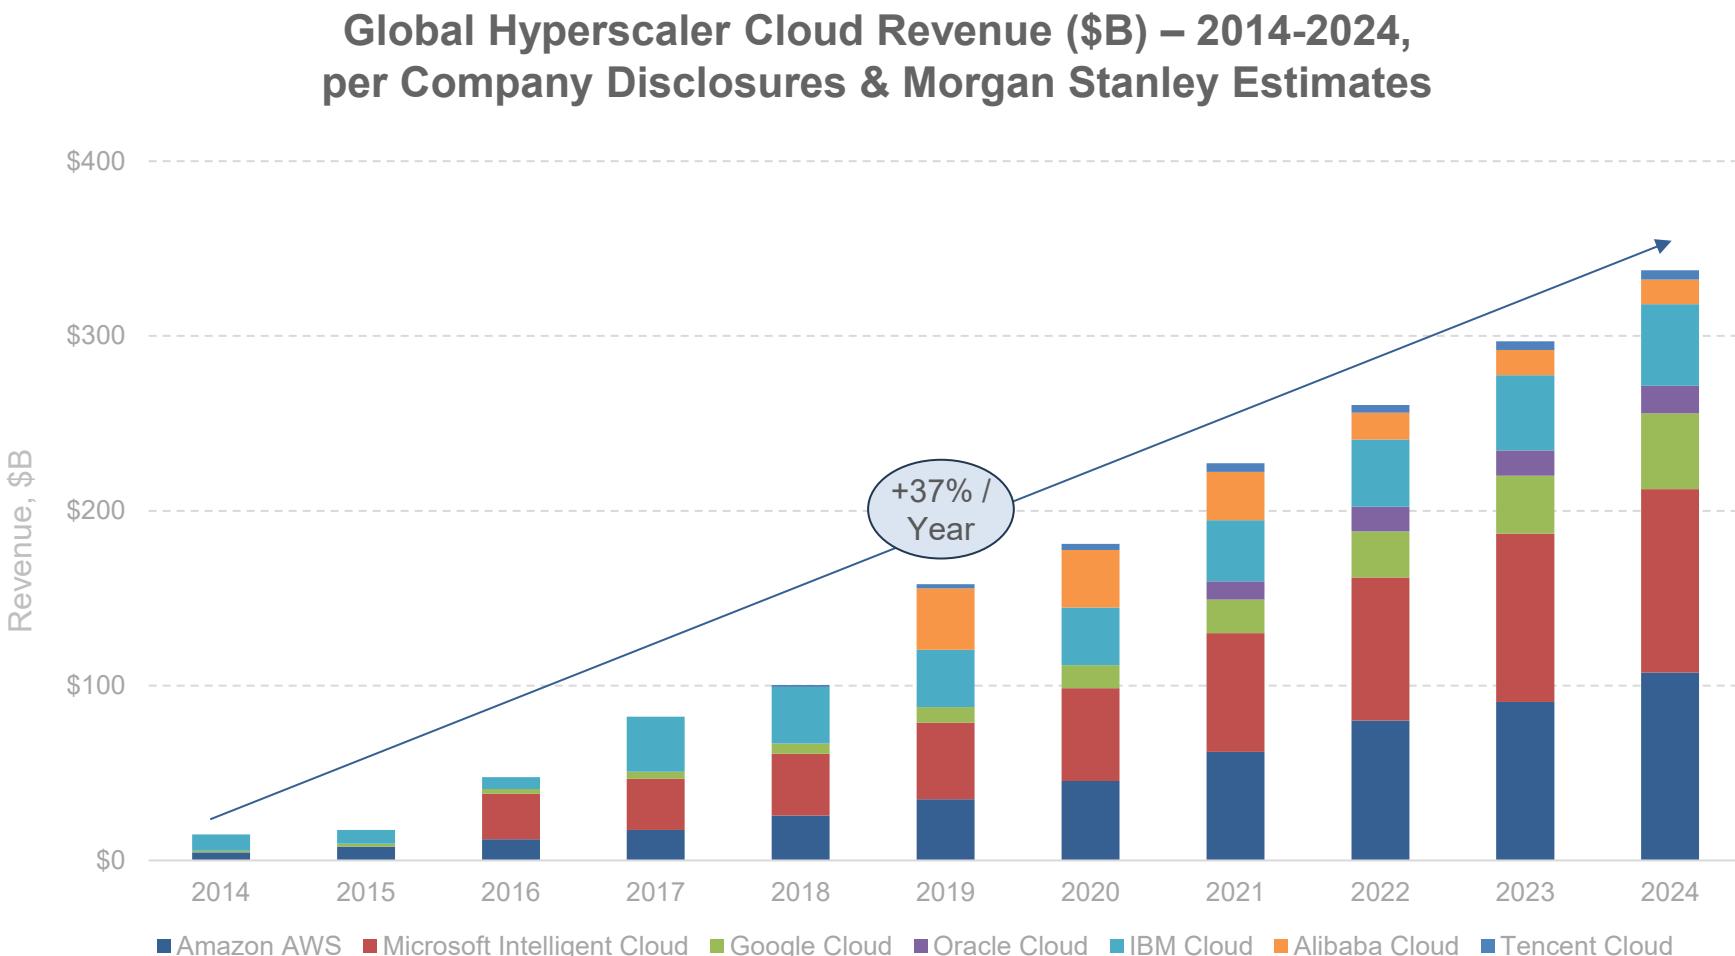

CapEx Spend @ Big Six* Tech Companies (USA) = +21% Annual Growth Over Ten Years

Tech CapEx Spend Driver =
Compute Spend to Train & Run AI Models

To understand the evolution of AI computing economics, it's constructive to look at where costs are concentrated – And where they're headed. The bulk of spending in AI large language model (LLM) development is still dominated by compute – specifically, the compute needed to train and run models.

Training costs remain extraordinarily high and are rising fast, often exceeding \$100 million per model today. As Dario Amodei, CEO of Anthropic, noted in mid-2024, *Right now, [AI model training costs] \$100 million. There are models in training today that are more like a billion... I think that the training of...\$10 billion models, yeah, could start sometime in 2025.*

Around these core compute costs sit additional high-cost layers: research, data acquisition and hosting, and a mix of salaries, general overhead, and go-to-market operations. Even as the cost to train models climbs, a growing share of total AI spend is shifting toward inference –

the cost of running models at scale in real-time. Inference happens constantly, across billions of prompts, queries, and decisions, whereas model training is episodic. As Amazon CEO Andy Jassy noted in his April 2025 letter to shareholders, *While model training still accounts for a large amount of the total AI spend, inference... will represent the overwhelming majority of future AI cost because customers train their models periodically but produce inferences constantly.*

NVIDIA Co-Founder & CEO Jensen Huang noted the same in NVIDIA's FQ1:26 earnings call, saying *Inference is exploding. Reasoning AI agents require orders of magnitude more compute.*

At scale, inference becomes a persistent cost center – one that grows in parallel with usage, despite declines in unit inference costs.

The broader dynamic is clear: lower per-unit costs are fueling higher overall spend.

As inference becomes cheaper, AI gets used more.

And as AI gets used more, total infrastructure and compute demand rises – dragging costs up again.

The result is a flywheel of growth that puts pressure on cloud providers, chipmakers, and enterprise IT budgets alike.

The economics of AI are evolving quickly – but for now, they remain driven by heavy capital intensity, large-scale infrastructure, and a race to serve exponentially expanding usage.

Data Centers =

Key Beneficiary of AI CapEx Spend

For one lens into the economics of AI infrastructure,
it's useful to look at the pace and scale of data center construction.

The current wave of AI-driven demand has pushed data center spending to historic highs.

According to Dell'Oro Research, global IT company data center CapEx
reached \$455 billion in 2024 and is accelerating.

Hyperscalers and AI-first companies alike are pouring billions into building out
compute-ready capacity – not just for storage, but for real-time inference and
model training workloads that require dense, high-power hardware.

As AI moves from experimental to essential, so too do data centers.

Per NVIDIA Co-Founder and CEO Jensen Huang, *These AI data centers...are, in fact, AI factories.*

That race is moving faster than many expected.

The most striking example may be xAI's Colossus facility in Memphis, Tennessee which went
from a gutted factory to a fully operational AI data center in just 122 days.

As noted on page 122, at 750,000 square feet – roughly the size of 418 average USA homes –
it was built in half the time it typically takes to construct a single American house.

Per NVIDIA Co-Founder & CEO Jensen Huang,
What they achieved is singular, never been done before...That is, like, superhuman...

...These kinds of timelines are no longer the exception. With prefabricated modules, streamlined permitting, and vertical integration across electrical, mechanical, and software systems, new data centers are going up at speeds that resemble consumer tech cycles more than real estate development.

But beneath that velocity lies a capital model that's anything but simple.

CapEx is driven by land, power provisioning, chips, and cooling infrastructure – especially as AI workloads push thermal and power limits far beyond traditional enterprise compute.

OpEx, by contrast, is dominated by energy costs and systems maintenance, particularly for high-density training clusters that operate near constant load.

Revenue is driven by compute sales – whether in the form of AI APIs, enterprise platform fees, or internal productivity gains. But payback periods are often long, especially for vertically-integrated players building ahead of demand. For newer entrants, monetization may lag build-out by quarters or even years.

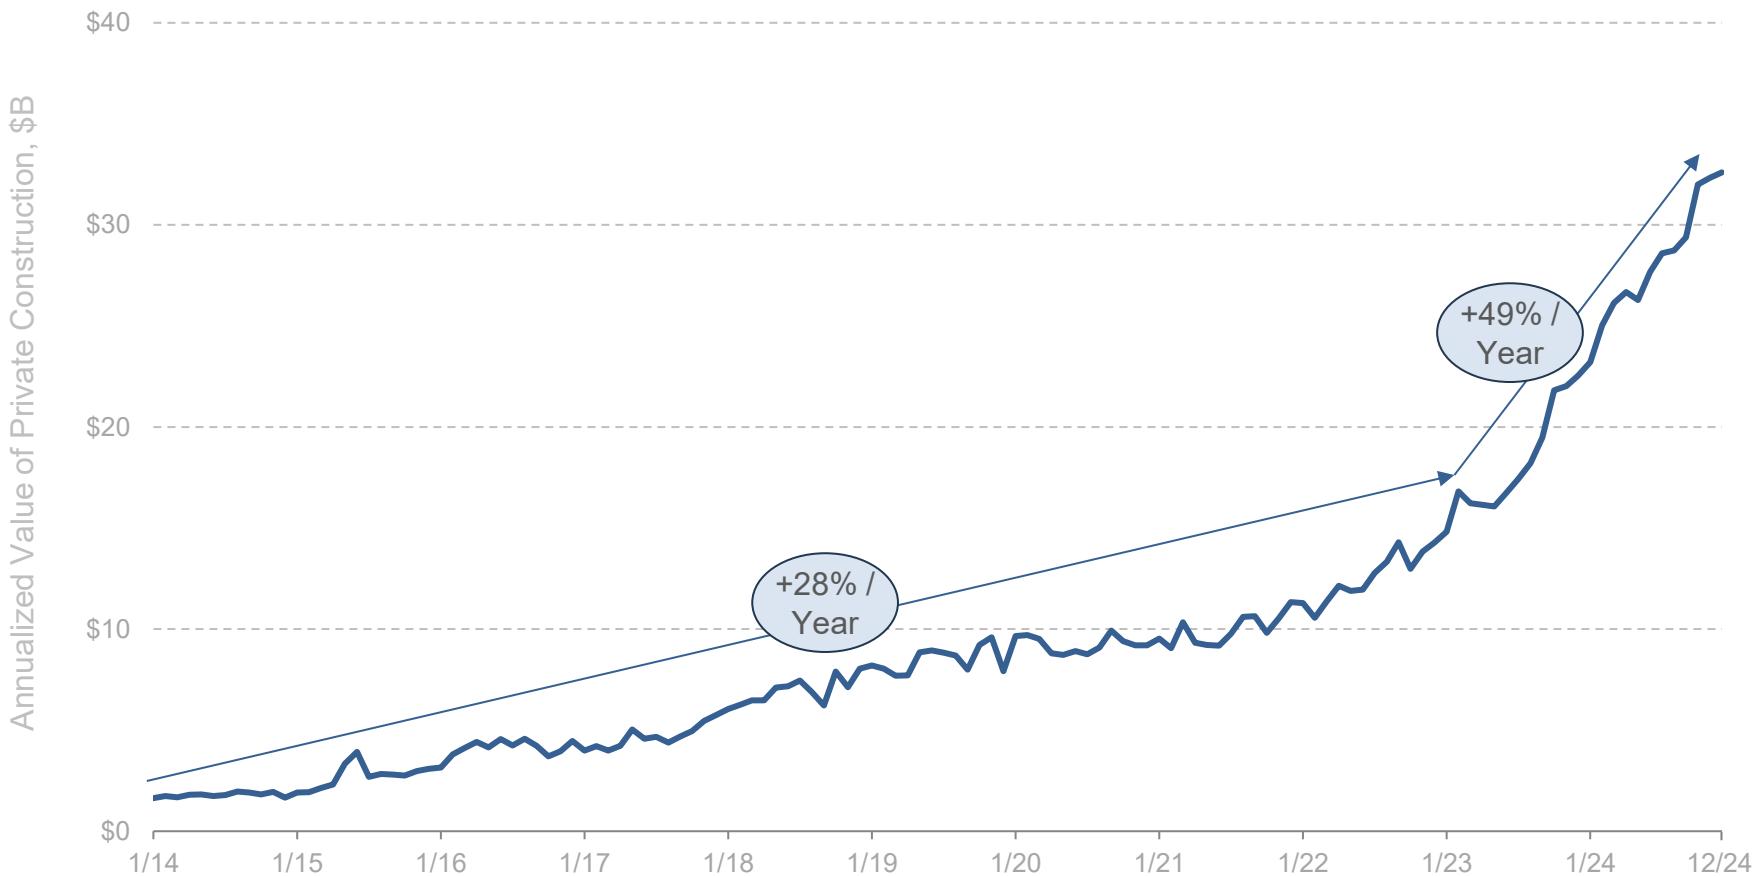

And then there's the supply chain. Power availability is becoming more of a gating factor.

Transformers, substations, turbines, GPUs, cables – these aren't commodities that can be spun up overnight. In this context, data centers aren't just physical assets – they are strategic infrastructure nodes. They sit at the intersection of real estate, power, logistics, compute, and software monetization.

The companies that get this right may do more than run servers – they will shape the geography of AI economics for the next decade.

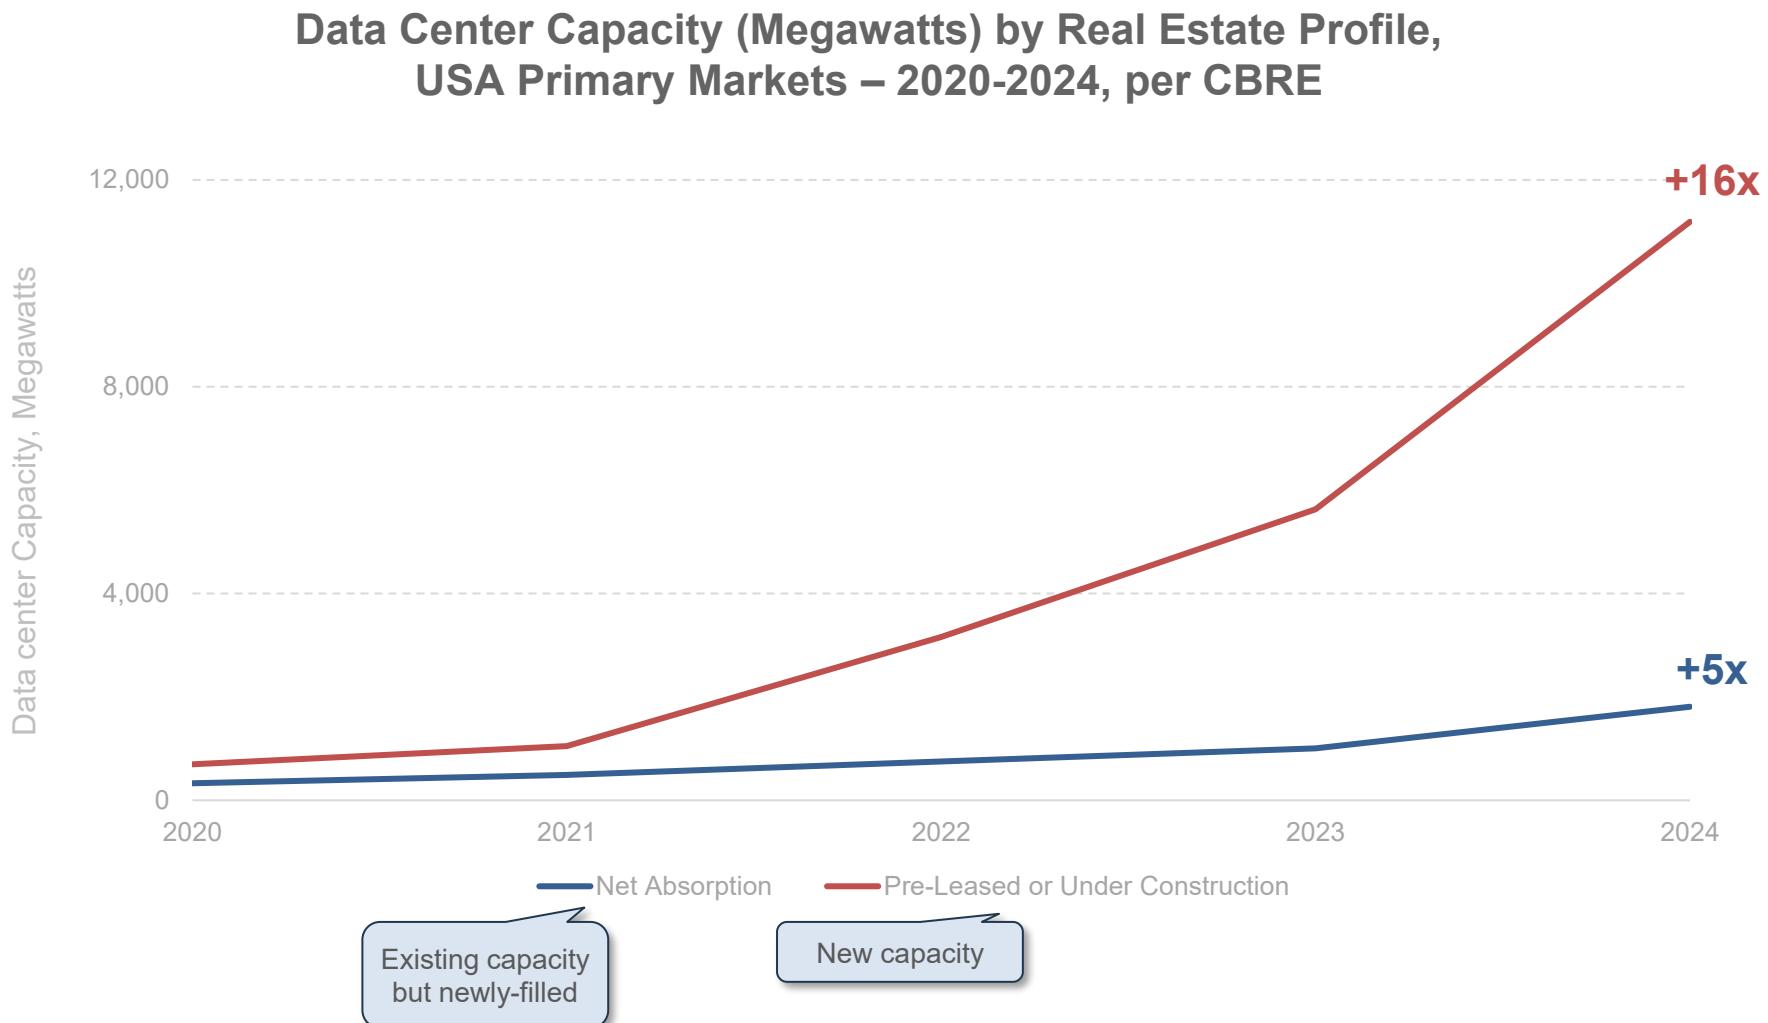

Data Center Buildout Construction Value, USA = +49% & Accelerated Annual Growth Over Two Years

USA Data Center Annualized Private Construction Value (\$B) – 1/14-12/24, per USA Census Bureau

Note: All data are seasonally adjusted. Data obtained via USA Census Bureau's Value of Construction Put in Place (VIP) Survey, which provides monthly estimates of the total dollar value of construction work done in USA. Data is annualized to avoid seasonal fluctuations. Source: USA Census Bureau

Data Center New Construction vs. Existing Capacity, USA = +16x in New vs. +5x in Existing Over Four Years

Data Centers =
Electricity Guzzlers

**AI and energy observations / quotes (in italics) here and the two pages that follow are from
'World Energy Outlook Special Report –
Energy and AI' ([link](#)) from IEA (International Energy Agency)* – 4/10/25**

To understand where energy infrastructure is heading, it helps to examine the rising tension between AI capability and electrical supply. The growing scale and sophistication of artificial intelligence is demanding an extraordinary amount of computational horsepower, primarily from AI-focused data centers.

These facilities – purpose-built to train and serve models – are starting to rival traditional heavy industry in their electricity consumption.

There is no AI without energy – specifically electricity (p. 3).

Data centers accounted for around 1.5% of the world's electricity consumption in 2024 (p. 14). Energy demand growth has been rapid: Globally, data centre electricity consumption has grown by around 12% per year since 2017, more than four times faster than the rate of total electricity consumption (p. 14).

As power demand rises, so too does its concentration:

The United States accounted for...[45% of global data centre electricity consumption], followed by China (25%) and Europe (15%)... nearly half of data centre capacity in the United States is in five regional clusters (p. 14).

The flipside is true as well: *Emerging and developing economies other than China account for 50% of the world's internet users but less than 10% of global data centre capacity (p. 18)...*

...AI's power demands are increasing – and its progress is increasingly bottlenecked not by data or algorithms, but by the grid and strains related to demand.

While AI presently places considerable demands on the energy sector, it is also already unlocking major energy efficiency and operational gains...

AI is already being deployed by energy companies to transform and optimize energy and mineral supply, electricity generation and transmission, and energy consumption (p. 16).

Current AI-driven demand is extremely high.

This is forecast to continue, especially as capital gushes into model providers that, in turn, spend on more compute. At some point, these model builders will need to turn a profit to be able to spend more.

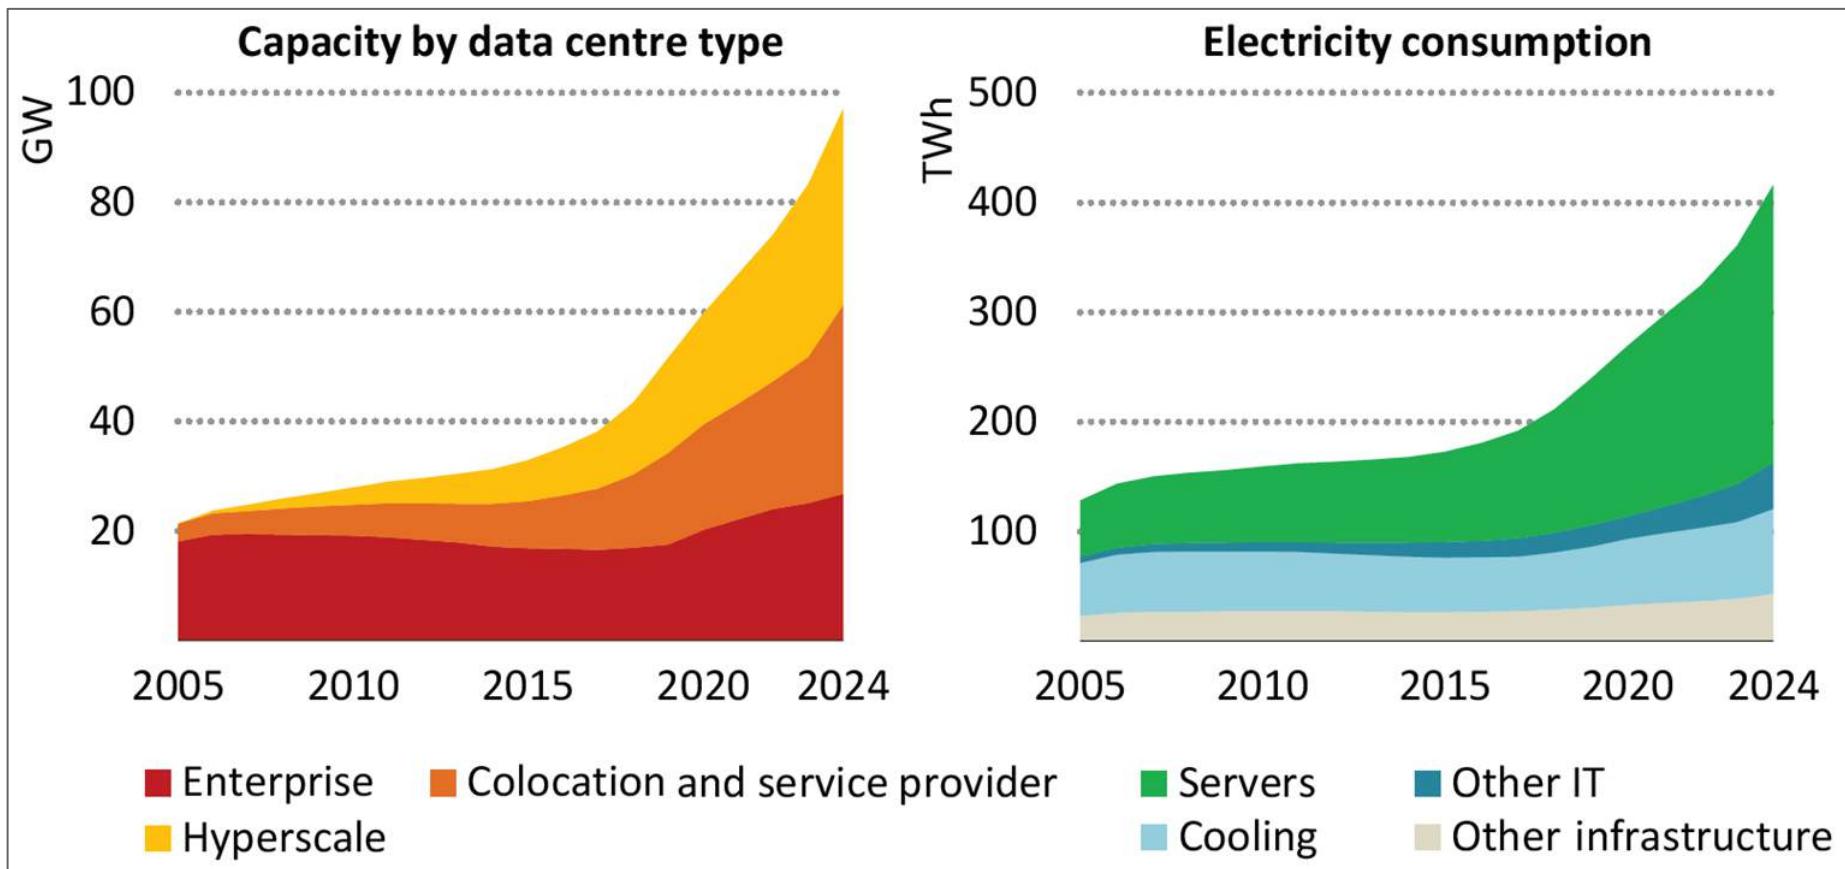

While demand – for both compute and energy – will inevitably continue to rise as consumer and business usage does the same, data centers will ultimately only serve those who pay their bills.

*IEA member countries include Australia, Austria, Belgium, Canada, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Japan, S. Real + Rapid

To understand where AI model economics may be heading, one can look at the mounting tension between capabilities and costs.

Training the most powerful large language models (LLMs) has become one of the most expensive / capital-intensive efforts in human history. As the frontier of performance pushes toward ever-larger parameter counts and more complex architectures, model training costs are rising into the billions of dollars.

Ironically, this race to build the most capable general-purpose models may be accelerating commoditization and driving diminishing returns, as output quality converges across players and differentiation becomes harder to sustain.

At the same time, the cost of applying/using these models – known as inference – is falling quickly.

Hardware is improving – for example, NVIDIA's 2024 Blackwell GPU consumes 105,000x less energy per token than its 2014 Kepler GPU predecessor. Couple that with breakthroughs in models' algorithmic efficiency, and the cost of inference is plummeting.

Inference represents a new cost curve, and – unlike training costs – it's arcing down, not up.

As inference becomes cheaper and more efficient, the competitive pressure amongst LLM providers increases – not on accuracy alone, but also on latency, uptime, and cost-per-token*. What used to cost dollars can now cost pennies. And what cost pennies may soon cost fractions of a cent.

The implications are still unfolding. For users (and developers), this shift is a gift: dramatically lower unit costs to access powerful AI.

And as end-user costs decline, creation of new products and services is flourishing, and user and usage adoption is rising.

For model providers, however, this raises real questions about monetization and profits.

Training is expensive, serving is getting cheap, and pricing power is slipping. The business model is in flux. And there are new questions about the one-size-fits-all LLM approach, with smaller, cheaper models trained for custom use cases** now emerging.

Will providers try to build horizontal platforms? Will they dive into specialized applications? Only time will tell.

In the short term, it's hard to ignore that the economics of general-purpose LLMs look like commodity businesses with venture-scale burn.

*Cost-per-token = The expense incurred for processing or generating a single token (a word, sub-word, or character) during the operation of a language model. It is a key metric used to evaluate the computational efficiency and cost-effectiveness of deploying AI models, particularly in applications like natural language processing.

AI Model Compute Costs High / Rising

+

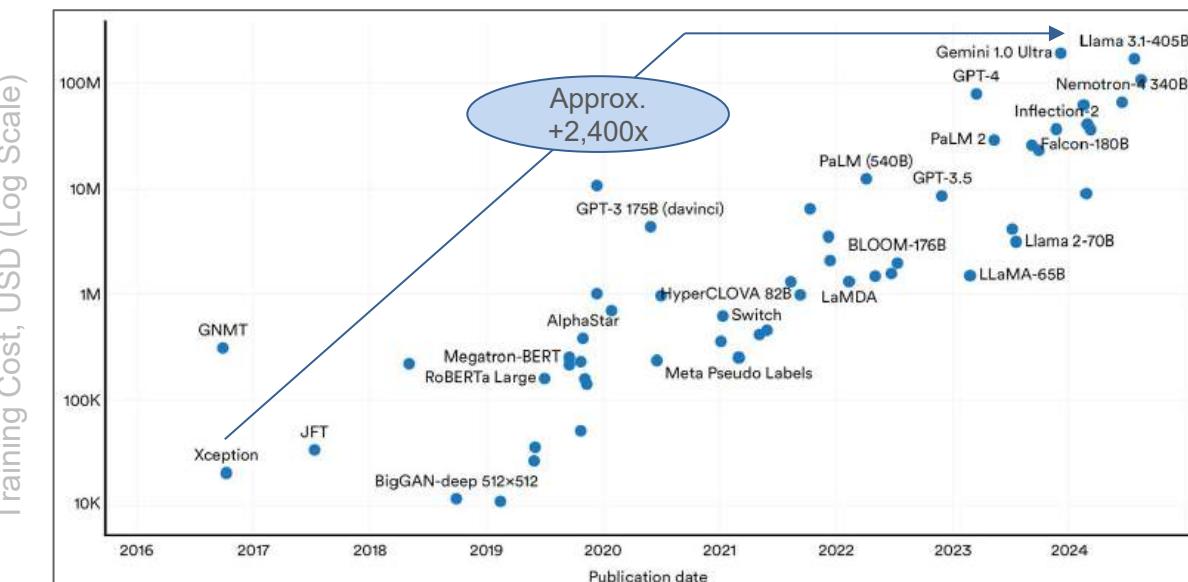

Inference Costs Per Token Falling

=

Performance Converging + Developer Usage Rising

AI Model Training Compute Costs = ~2,400x Growth Over Eight Years, per Epoch AI & Stanford

Estimated Training Cost of Frontier AI Models – 2016-2024, per Epoch AI & Stanford

Right now, [AI model training costs] \$100 million. There are models in training today that are more like a billion. Right. I think if we go to \$10 or \$100 billion, and I think that will happen in 2025, 2026, maybe 2027...

...I think that the training of...\$10 billion models, yeah, could start sometime in 2025.

- Anthropic Co-Founder & CEO
Dario Amodei (6/24)

Note: Costs are estimates. Excludes most Chinese models due to lack of reliable cost data. Source: Epoch AI via Nestor Maslej et al., 'The AI Index 2025 Annual Report,' AI Index Steering Committee, Stanford HAI (4/25); In Good Company podcast (6/24)

AI Model Compute Costs High / Rising

+

Inference Costs Per Token Falling

=

Performance Converging + Developer Usage Rising

To understand the trajectory of AI compute, it helps to revisit an idea from the early days of PC software. ‘Software is a gas...it expands to fill its container,’ said Nathan Myhrvold, then CTO of Microsoft in 1997. AI is proving no different. As models get better, usage increases – and as usage increases, so does demand for compute. We’re seeing it across every layer: more queries, more models, more tokens per task.

The appetite for AI isn’t slowing down. It’s growing into every available resource – just like software did in the age of desktop and cloud.

But infrastructure is not just standing still. In fact, it’s advancing faster than almost any other layer in the stack, and at unprecedented rates. As noted on page 136, NVIDIA’s 2024 Blackwell GPU uses 105,000 times less energy to generate tokens than its 2014 Kepler predecessor.

It’s a staggering leap, and it tells a deeper story – not just of cost reduction, but of architectural and materials innovation that is reshaping what’s possible at the hardware level.

These improvements in hardware efficiency are critical to offset the strain of increasing AI and internet usage on our grid. So far, though, they have not been enough.

This trend aligns with Jevons Paradox, first proposed back in 1865* – that technological advancements that improve resource efficiency actually lead to increased overall usage of those resources. This is driving new focus on expanding energy production capacity – and new questions about the grid’s ability to manage.

Yet again, we see this as one of the perpetual ‘a-ha’s’ of technology: costs fall, performance rises, and usage grows, all in tandem. This trend is repeating itself with AI.

*British economist William Stanley Jevons first observed this phenomenon in 19th-century Britain, where he noticed that improvements in the efficiency of coal-powered steam engines were not reducing coal consumption but rather increasing it. In his book *The Coal Question*, he noted ‘It is wholly a confusion of ideas to suppose that the economical use of fuel is equivalent to diminished consumption. The very contrary is the truth.’

AI Inference 'Currency' = Tokens

What are tokens and how to count them?

Updated over 3 months ago

What are tokens?

Tokens can be thought of as pieces of words. Before the API processes the request, the input is broken down into tokens. These tokens are not cut up exactly where the words start or end - tokens can include trailing spaces and even sub-words. Here are some helpful rules of thumb for understanding tokens in terms of lengths:

- 1 token ~ = 4 chars in English
- 1 token ~ = $\frac{3}{4}$ words
- 100 tokens ~ = 75 words

Or

- 1-2 sentence ~ = 30 tokens
- 1 paragraph ~ = 100 tokens
- 1,500 words ~ = 2048 tokens

To get additional context on how tokens stack up, consider this:

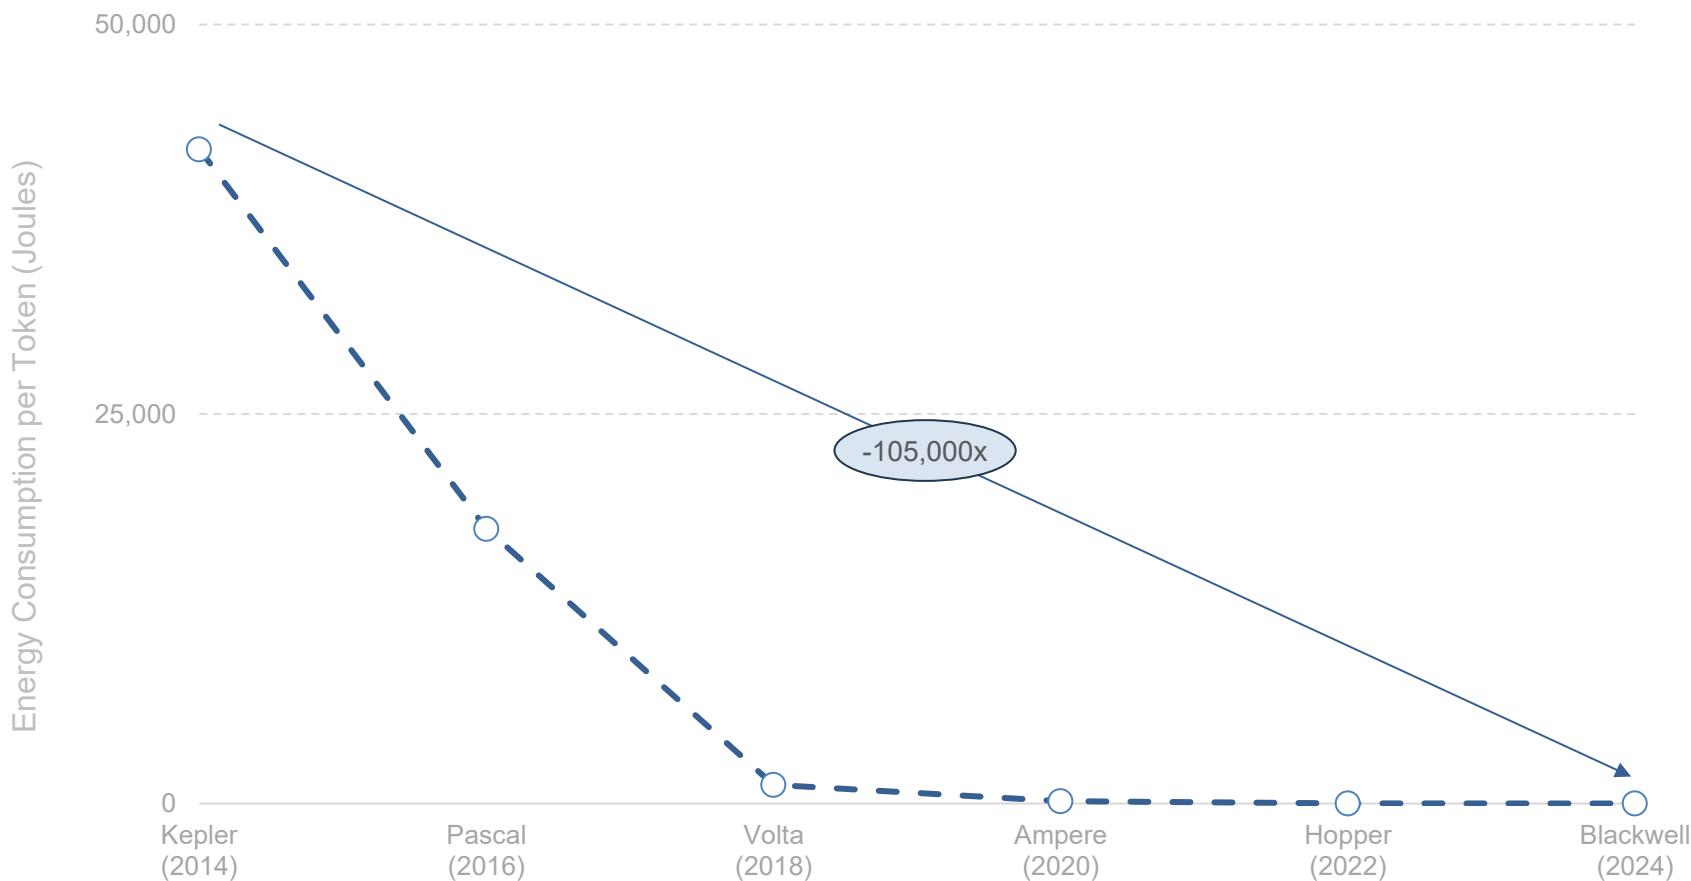

- Wayne Gretzky's quote "*You miss 100% of the shots you don't take*" contains 11 tokens.
- OpenAI's charter contains 476 tokens.
- The transcript of the US *Declaration of Independence* contains 1,695 tokens.

Additional context: 1MM tokens =
~750,000 words...roughly
• 3,500 pages of a standard book
(12-point font, double-spaced)
• 5,000 ChatGPT responses*

*Assumes that the average ChatGPT interaction consumes 200 total tokens (input + output), or 150 words. Thus, 1MM tokens equates to roughly 5,000 ChatGPT responses.

Inference Costs Per Token Falling
=

Performance Converging + Developer Usage Rising

To understand the surge in AI developer activity, it's instructive to look at the extraordinary drop in inference costs and the growing accessibility of capable models.

Between 2022 and 2024, the cost-per-token to run language models fell by an estimated 99.7% – a decline driven by massive improvements in both hardware and algorithmic efficiency.

What was once prohibitively expensive for all but the largest companies
is now within reach of solo developers,
independent app builders, researchers on a laptop, and mom-and-pop shop employees.

The cost collapse has made experimentation cheap, iteration fast,
and productization feasible for virtually anyone with an idea.

At the same time, performance convergence is shifting the calculus on model selection.
The gap between the top-performing frontier models and smaller, more efficient alternatives is narrowing.

For many use cases – summarization, classification, extraction, or routing –
the difference in real-world performance is negligible.

Developers are discovering they no longer need to pay
a premium for a top-tier model to get reliable outputs. Instead, they can run cheaper models locally or
via lower-cost API providers and achieve functionally similar results,
especially when fine-tuned on task-specific data.

This shift is weakening the pricing leverage of model incumbents
and leveling the playing field for AI development...

...At the platform level, a proliferation of foundation models has created a new kind of flexibility. Developers can now choose between dozens of models – OpenAI's ChatGPT, Meta's Llama, Mistral's Mixtral, Anthropic's Claude, Google's Gemini, Microsoft's Phi, and others – each of which excels in different domains. Some are optimized for reasoning, others for speed or code generation. The result is a move away from vendor lock-in.

Instead of consolidating under a single provider who can gate access or raise prices, developers are distributing their efforts across multiple ecosystems. This plurality of options is empowering a new wave of builders to choose the best-fit model for their technical or financial needs.

What's emerging is a flywheel of developer-led infrastructure growth.

As more developers build AI-native apps, they also create tools, wrappers and libraries that make it easier for others to follow. New front-end frameworks, embedding pipelines, model routers, vector databases, and serving layers are multiplying at an accelerating rate.

Each wave of developer activity reduces the friction for the next, compressing the time from idea to prototype

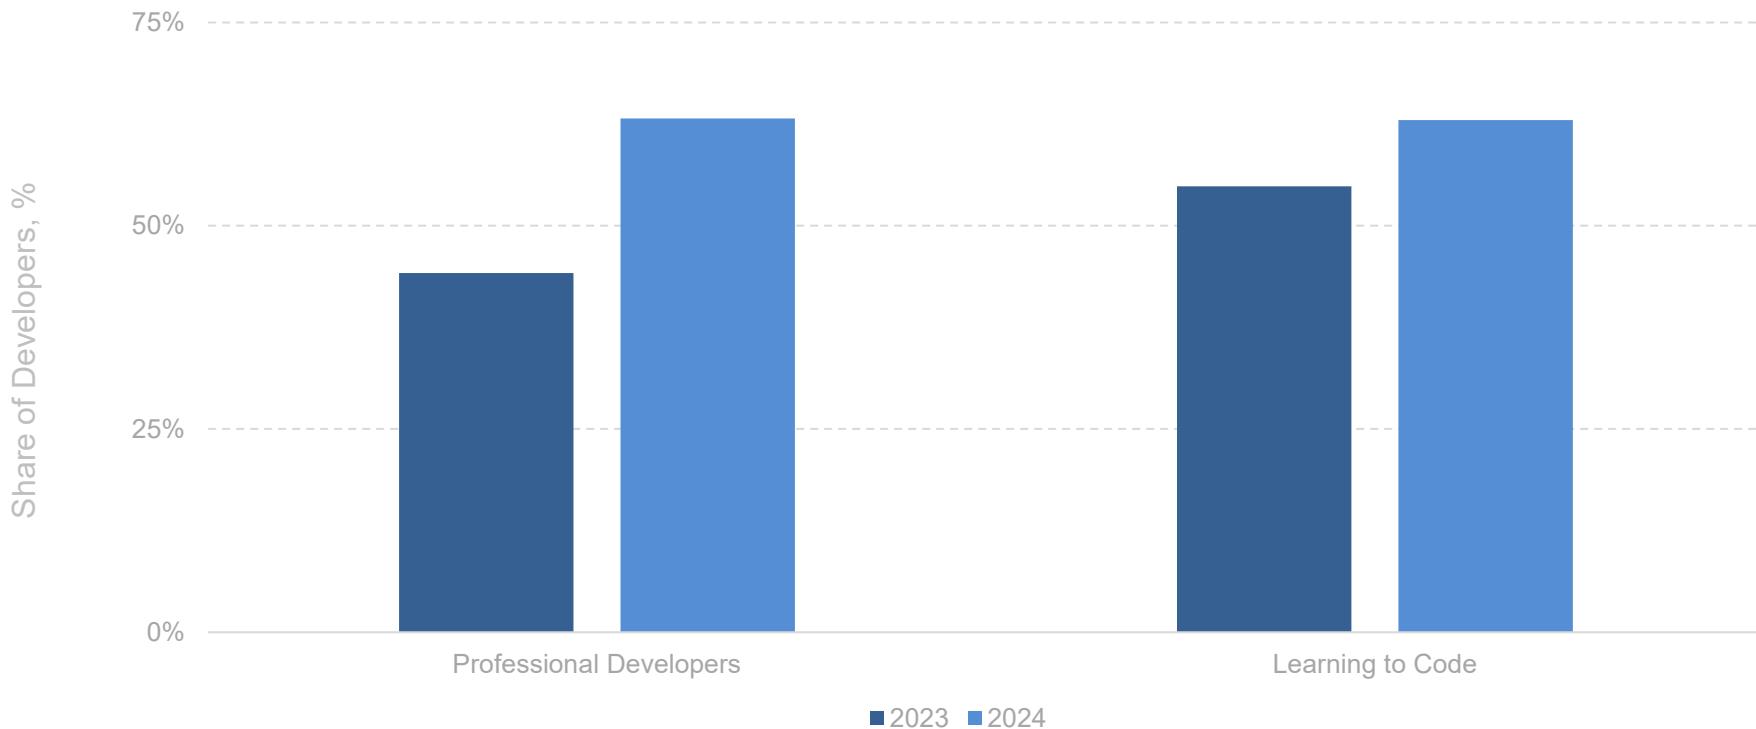

and from prototype to product. In the process, the barrier to building with AI is collapsing – not just in cost, but in complexity. This is no longer just a platform shift. It's an explosion of creativity.

Technology history has shown – as memorialized by then-Microsoft President Steve Ballmer's repeat *Developers! Developers! Developers...* at a 2000 Microsoft Developers Conference ([link](#)) – the platform that gets the most consistent developer user and usage momentum – and can scale and steadily improve – wins.

The AI Developer Next Door

AI Tool Adoption by Developers = 63% vs. 44% Y/Y

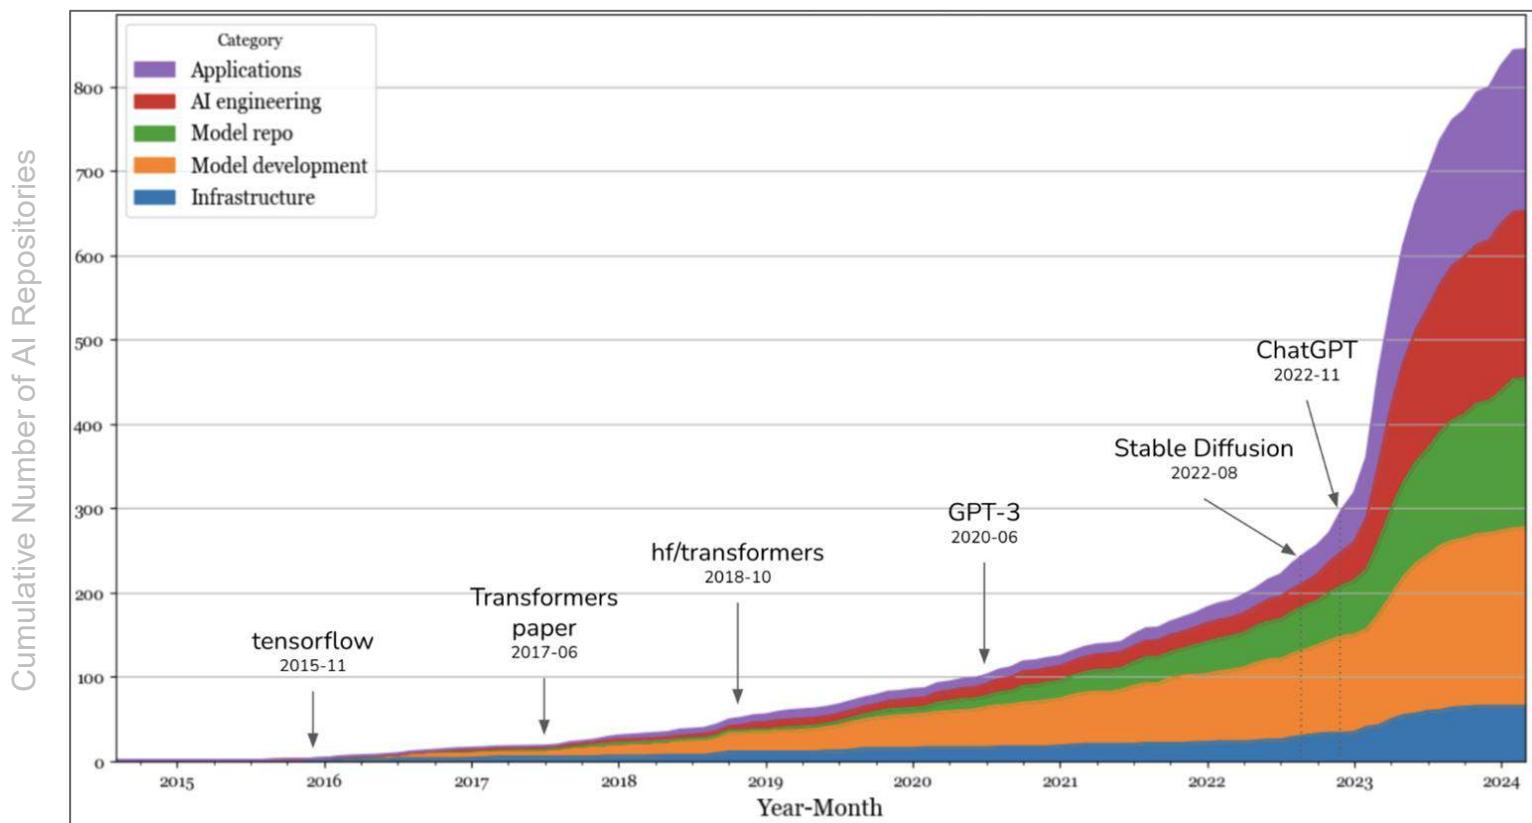

Share of Developers Currently Using AI in Development Processes – 2023-2024, per Stack Overflow

Note: 2023 N=89,184; 2024 N=65,437. Respondents are global. Source: Stack Overflow Developer Surveys (5/23 & 5/24-6/24)

AI Developer Repositories – GitHub = ~175% Increase Over Sixteen Months

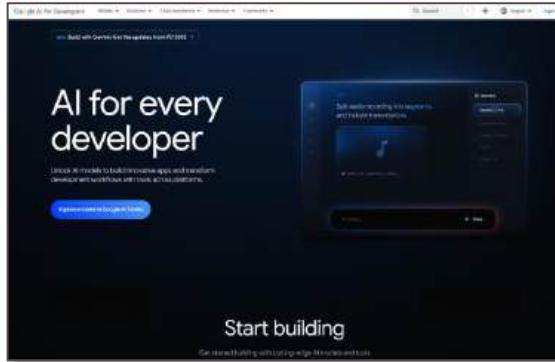

Number of AI Developer Repositories* on GitHub – 11/22-3/24, per Chip Huyen

*A repository is an online storage space where developers share and manage code, models, data, and documentation related to artificial intelligence projects. These enable collaboration, reuse, and distribution of AI tools and assets. Analysis shown includes GitHub repositories with 500+ stars. Infrastructure = tools for model serving, compute management, vector search & databases. Model development = frameworks for modeling & training, inference optimization, dataset engineering, & model evaluation. Application development = custom AI-powered applications (varied use cases). Source: Chip Huyen via GitHub (3/24)

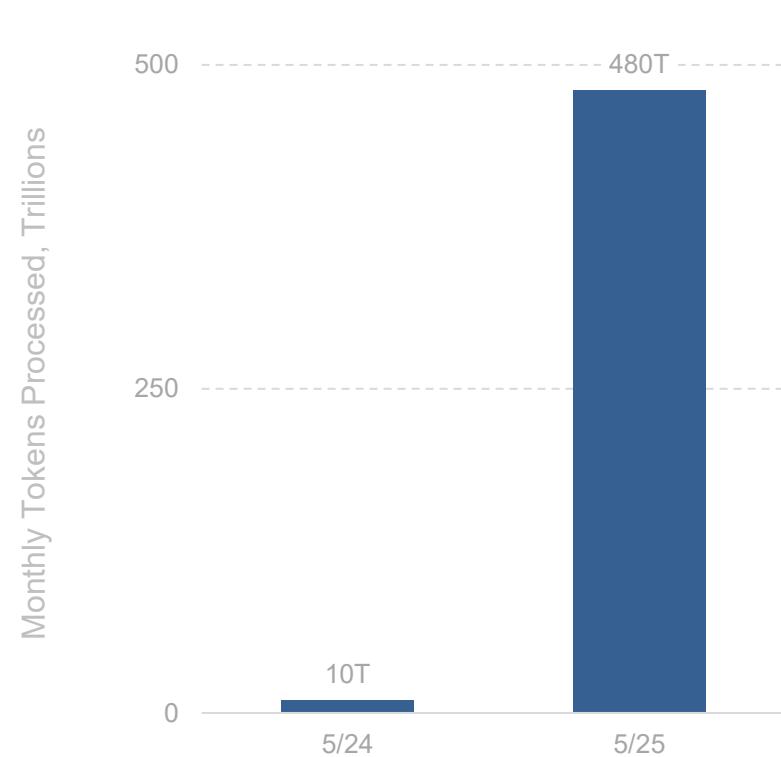

AI Developer Ecosystem – Google = +50x Monthly Tokens Processed Y/Y

Google Monthly Tokens Processed (T) – 5/24-5/25, per Google

This time last year, we were processing 9.7 trillion tokens a month across our products and APIs. Now, we're processing over 480 trillion – that's 50 times more.

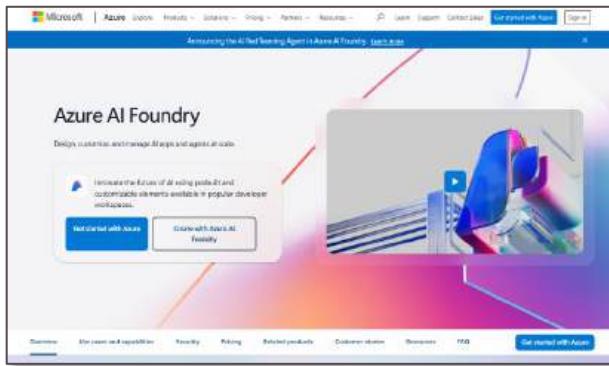

- Google I/O 2025 Press Release, 5/25

Note: Token usage shown across Google products & APIs. Per Google in 5/25, 'This time last year, we were processing 9.7 trillion tokens a month across our products and APIs. Now, we're processing over 480 trillion – that's 50 times more...Over 7 million developers are building with Gemini, five times more than this time last year.' Source: Google, 'Google I/O 2025: From research to reality' (5/25)

AI Developer Ecosystem – Microsoft Azure AI Foundry = +5x Quarterly Tokens Processed Y/Y

Microsoft Azure AI Foundry Quarterly Tokens Processed (T) – Q1:24-Q1:25, per Microsoft

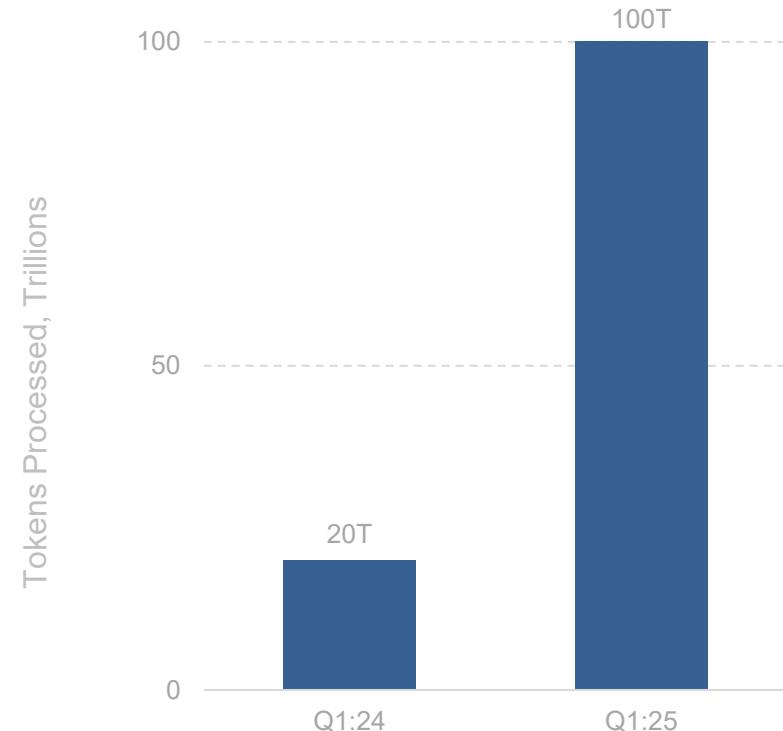

[Microsoft Azure AI] Foundry is the agent and AI app factory.

It is now used by developers at over 70,000 enterprises and digital natives – from Atomicwork, to Epic, Fujitsu, and Gainsight, to H&R Block and LG Electronics – to design, customize, and manage their AI apps and agents.

We processed over 100 trillion tokens this quarter, up 5x year-over-year – including a record 50 trillion tokens last month alone.

Real + Rapid

It's different this time, we'll make it up on volume, and we'll figure out how to monetize our users in the future are typically three of the biggest danger statements in business.

That said, in technology investing every once in awhile they can be gold – Amazon, Alphabet (Google), Meta (Facebook), Tesla, Tencent, Alibaba, Palantir...

In AI, it may indeed be different this time, and the leader(s) will make it up on volume and be able to monetize users in the future. Though now, 'different this time' also means that competition is unprecedented...

We have never seen so many founder-driven / assisted (ex. Apple) companies* with market capitalizations in excess of \$1 trillion – most with gross margins of +50% plus free cash flow – attacking the same opportunity at the same time in a relatively transparent world, adding in high stakes competition between global powers – China and the United States.

Ernest Hemingway's phrase *gradually, then suddenly* from 'The Sun Also Rises' applies to technology tipping points.

The tipping point for personal computers was the introduction of Apple's Macintosh (1984) and Microsoft's Windows 3.0 (1990). With the Internet it was Netscape's IPO (1995). With the Mobile Internet it was Apple's iPhone App Store launch (2008).

With Cloud Computing it was the launch of AWS (Amazon Web Services) foundational products (2006-2009).

With AI it was the launch of NVIDIA's A100 GPU chip (2020) and OpenAI's public version of ChatGPT (2022).

In effect, the global competition for AI kicked in with the launch of China's DeepSeek (1/25) and Jack Ma's attendance at Chinese President Xi Jinping's symposium of Chinese business leaders (2/25).

The money to fund AI's growth (and losses) comes from big companies with big free cash flow and big balance sheets, in addition to wealthy and ambitious capital providers from around the world.

No doubt, this dynamic combination of competition / capital / entrepreneurship will rapidly advance AI, a riddle is determining which business models will be the last ones standing.

*Companies include NVIDIA, Microsoft, Amazon, Alphabet (Google), Meta (Facebook) & Tesla

Technology Disruption Pattern Recognition = Hundreds of Years of Consistent Signals

Technology disruption has a long-repeating rhythm: early euphoria, break-neck capital formation, bruising competition, and – eventually – clear-cut winners and losers.

Alasdair Nairn's 'Engines That Move Markets' ([link here](#)) distills two centuries of such cycles, and his observations are prescient for today's AI boom.

Highlights of his observations follow...

There were several years of strong share-price growth when the railways were supplanting canals. The bubble of the 1840s deflated under the weight of overheated expectations and changing economic conditions...

...Any technological advance which requires huge capital expenditure always runs a real risk of disappointing returns in the early years, even if it is ultimately successful...

...Any technology that necessitates heavy capital expenditure and requires returns to be earned over an extended period is always going to be a high-risk undertaking – unless, that is, there is some form of protection against competition...

...The winners of these competitive struggles are not always those who have the best technology, but those who can most clearly see the way that an industry or market is likely to develop...

...One of the clearest lessons of corporate and investment history is that without some barrier to entry, first-mover advantage can be swiftly lost...

...A theme that recurs throughout this research is that while identifying the winners from any new technology is often perilous and difficult, it is almost invariably simpler to identify who the 'losers' are going to be.

AI-Related Monetization =

Very Robust Ramps

To understand the evolution of AI hardware strategy, we'll look at how control over chip design is shifting from traditional vendors to the platforms that rely on them.

For years, NVIDIA has been at the center of the AI hardware stack.

Its GPUs (graphics processing units) became the default engine for training and inference, prized for their ability to handle highly parallel computations at scale. Its proprietary technology – and unparalleled scale – has led to industry leadership.

This reliance – combined with outsized sudden demand – has created constraints.

Despite NVIDIA's rapid – and impressive – scale-up, demand for NVIDIA GPUs has outpaced supply amid industry fervor for accelerated computing. Hyperscalers and cloud providers are moving to improve their supply chains to manage long lead times.

That shift is accelerating the rise of custom silicon – especially ASICs, or application-specific integrated circuits. Unlike GPUs, which are designed to support a wide range of workloads, ASICs are purpose-built to handle specific computational tasks with maximum efficiency. In AI, that means optimized silicon for matrix multiplication, token generation, and inference acceleration.

Google's TPU (Tensor Processing Unit) and Amazon's Trainium chips are now core components of their AI stacks. Amazon claims its Trainium2 chips offer 30-40% better price-performance than standard GPU instances, unlocking more affordable inference at scale. These aren't side projects – they're foundational bets on performance, economics, and architectural control...

...Custom chips also reflect a broader effort to manage the economics of AI infrastructure. As Amazon CEO Andy Jassy noted in early 2025, *AI does not have to be as expensive as it is today, and it won't be in the future*. Custom silicon is one lever to control these expenses.

At the same time, a new ecosystem of infrastructure specialists is emerging to meet this demand.

CoreWeave has become one of the fastest-scaling cloud GPU providers, repurposing gaming and Crypto hardware supply chains to serve enterprise AI customers.

Oracle, long seen as a legacy IT vendor, has repositioned itself as a GPU-rich cloud platform with AI-specific offerings. Astera Labs, a lesser-known but critical player, builds high-speed interconnects that move data between GPUs and memory systems with minimal latency – an increasingly important performance constraint.

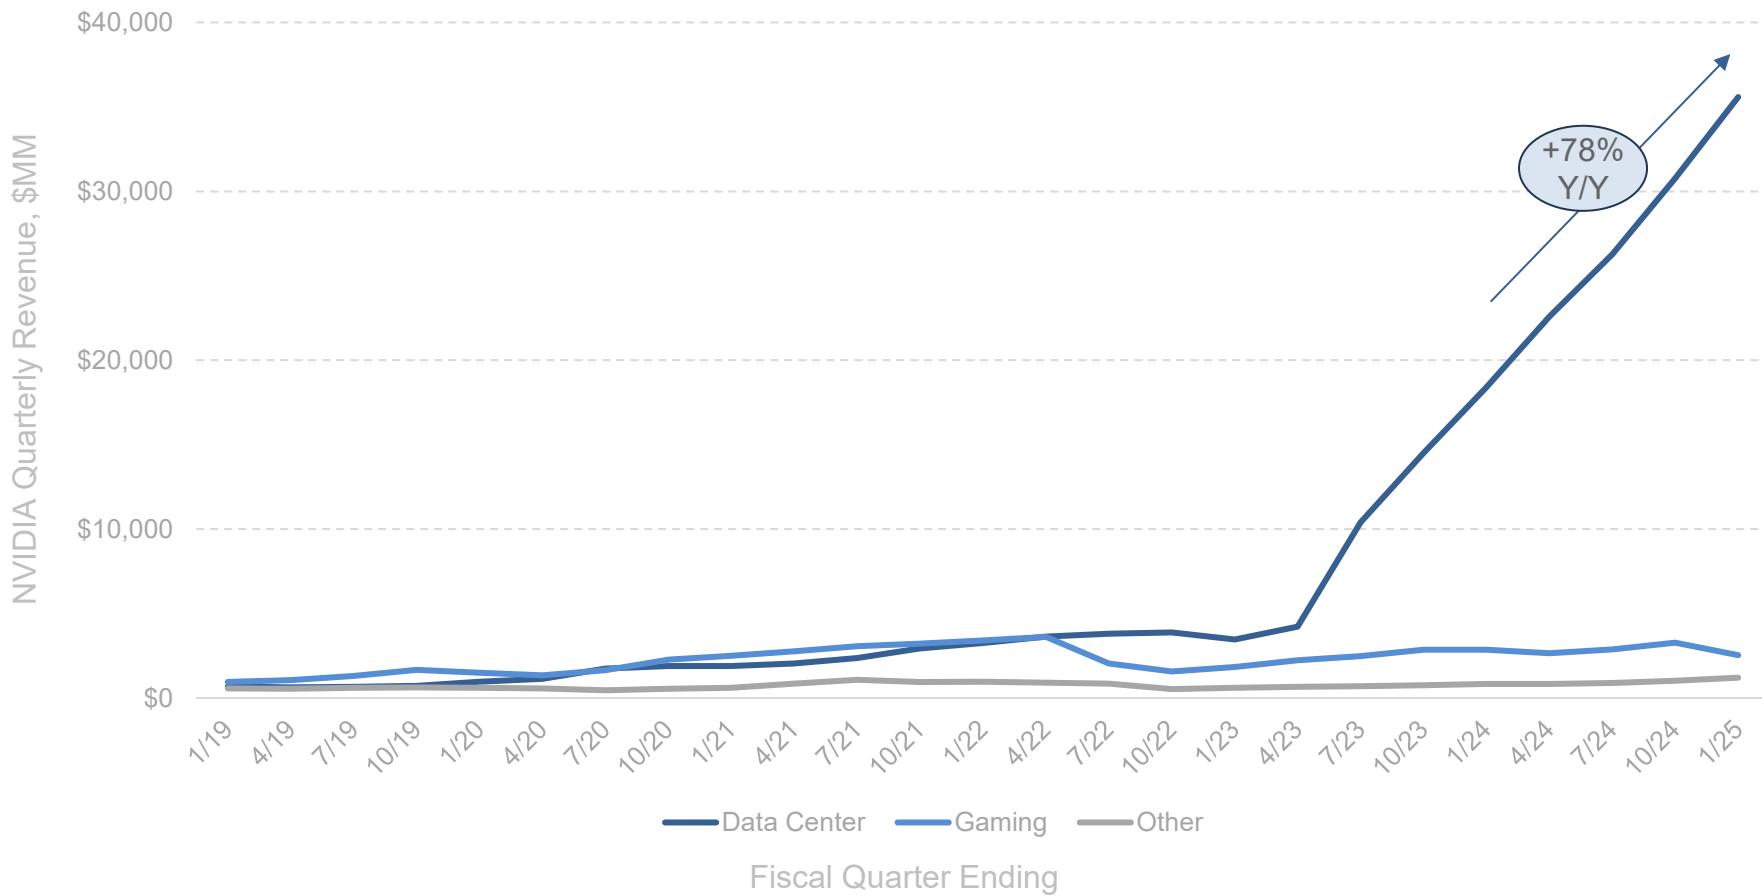

These firms aren't building foundation models, but they're building what foundation models depend on.

As compute demand compounds, they're becoming essential infrastructure in a market where speed, availability, and efficiency are important differentiators.

AI Monetization =
Chips

AI Monetization...Chips = NVIDIA Quarterly Revenue +78% to \$39B Y/Y...

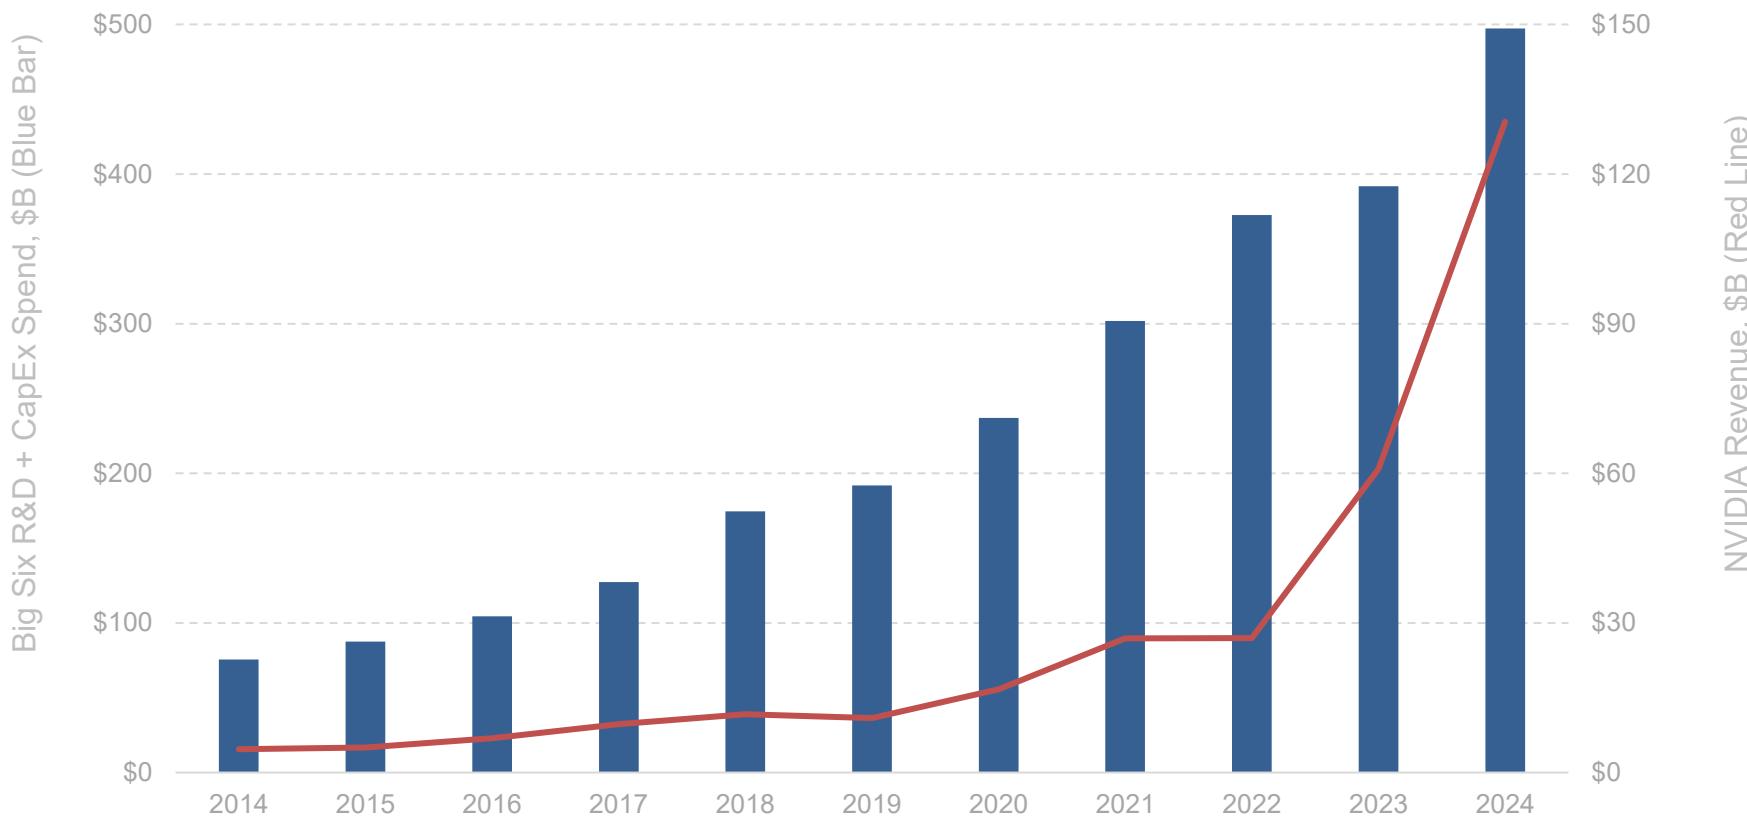

NVIDIA Quarterly Revenue by Business Line (\$B) – 1/19-1/25, per NVIDIA

Valuation-to-Revenue Multiple – OpenAI = Looks Expensive...

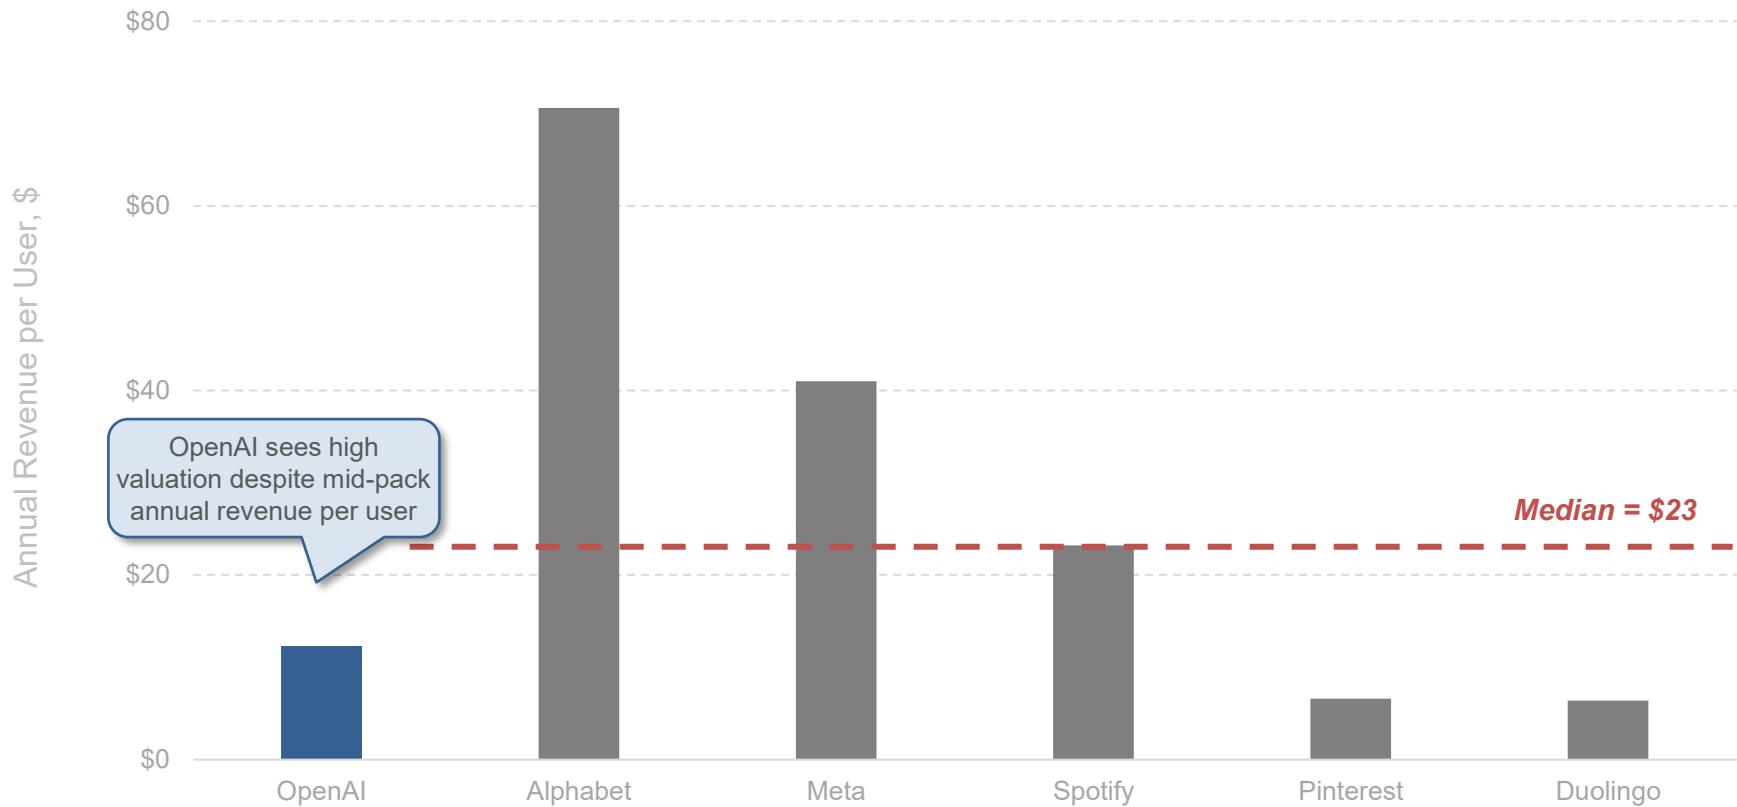

**Estimated Enterprise Value / Next 12 Months Revenue Multiple – 5/25,
per Capital IQ & Bloomberg**

Note: OpenAI figures are estimates. Next 12 months revenue multiples for companies other than OpenAI are consensus estimates per Capital IQ. OpenAI NTM revenue estimates are as of 12/24 due to data availability. Source: Capital IQ (5/15/25), Bloomberg ([link](#))

...Revenue-per-User Multiple – OpenAI = In-the-Range

Estimated Annual Revenue Per User (\$) – 2024, per Capital IQ, Morgan Stanley, Semrush, *The Information* & Company Disclosures

Note: OpenAI figures are estimates as of 4/25. All other public-company figures are as of 12/31/24, using CY2024 data. OpenAI data uses WAUs due to data availability (conservatively assumed as MAUs); other figures use MAUs. Here we assume average weekly active ChatGPT users of 300MM based off OpenAI's 12/24 disclosure. We estimate 2024 ChatGPT revenue of \$3.7B, per company estimates. Monthly active user figures are estimates for Alphabet based off website traffic measurements & global internet user data. Meta last reported MAPs for app family in Q4:23, we conservatively assume no growth since.

Source: Capital IQ (12/24), *The Information* (4/25 and prior) ([link](#), [link](#), [link](#), [link](#) & [link](#)), Semrush (11/24), Morgan Stanley, ITU, company disclosures, BOND estimates

As global digital user bases have grown and potential rapidity of usage traction has risen in tandem, areas of corporate investment (for companies new and old) have become increasingly competitive and capital-intensive.

The AI tech cycle of creative disruption has historical analogs.

Head turners of the semi-recent past include Apple's near bankruptcy in 1997 when its market capitalization was \$1.7B*, now \$3.2T.

Amazon.com's near death moment happened in Q4:00 when it reported a net loss of -\$545MM on revenue of \$972MM.

Founder and then-CEO Jeff Bezos noted in the 2000 Shareholder Report that *It's been a brutal year for many in the capital markets and certainly for Amazon.com shareholders.*

As of this writing, our shares are down more than 80% from when I wrote you last year.

At post-loss trough in Q3:01 its market cap was \$2.2B while it supported 23MM active customer accounts.

The market cap is now \$2.2T.

All in, Amazon lost -\$3B in the twenty-seven quarters between its launch in Q2:97 and the end of its first net income-positive year (2003).

For its most recent twenty-seven most recent quarters (Q3:18-Q1:25), Amazon's cumulative net income was \$176B.

Google's IPO filing (April 2004) noted that in Q1:04, after having only raised a Series A funding round, it spent 22% of revenue (\$86MM of \$390MM) on capital expenditures – at the time it was an incomprehensibly high number.

It went public at a \$23B market cap, now \$2.0T...

*Market capitalization taken as of 7/1/97. Microsoft finalized its investment in Apple just over one month later, on 8/6/97.
Note: Present market capitalization figures are shown as of 5/14/25.

...Uber burned -\$17B* between 2016 and 2022 (and materially more before that) before its first free cash flow-positive year in 2023.

In 2022, it had 131MM monthly active platform consumers.

Uber's last equity financing was a Series G.

Its fully-diluted IPO market cap was \$82B, now \$189B.

Tesla burned -\$9.2B between 2009 and 2018 before becoming free cash flow positive in 2019. In the ten years between 2009 and 2018, it lost a cumulative -\$5.6B delivering ~540K vehicles.

It went public in 2010 at a market cap of \$1.6B.

From 2019-2024, it then earned \$40B delivering 6.7MM vehicles.

Its market cap is now \$1.1T.

It is important to remember – most of the time, when all is said and done – a business's valuation should represent the present value of its future free cash flows.

The aforementioned companies – with aggressive cash burn – tested this premise hard, built large-scale data-driven network effects

based on product excellence / constant improvement, developed technology-driven competitive advantage and ultimately proved the naysayers wrong.

Only time will tell which side of the money-making equation the current AI aspirants will land.

*Measured as unlevered free cash flow.

Note: Present market capitalization figures are shown as of 5/14/25.

Usage + Cost + Loss Growth =

Unprecedented...

What About Future Monetization + Profits?

AI Monetization Possibilities =
New Entrants & / Or Tech Incumbents?

To understand where AI model economics may be heading, one can look at the mounting tension between capabilities and costs.

Training the most powerful large language models (LLMs) has become one of the most expensive / capital-intensive efforts in human history. As the frontier of performance pushes toward ever-larger parameter counts and more complex architectures, model training costs are rising into the billions of dollars.

Ironically, this race to build the most capable general-purpose models may be accelerating commoditization and driving diminishing returns, as output quality converges across players and differentiation becomes harder to sustain.

At the same time, the cost of applying/using these models – known as inference – is falling quickly. Hardware is improving – for example, NVIDIA's 2024 Blackwell GPU consumes 105,000x less energy per token than its 2014 Kepler GPU predecessor. Couple that with breakthroughs in models' algorithmic efficiency, and the cost of inference is plummeting.

Inference represents a new cost curve, and – unlike training costs – it's arcing down, not up. As inference becomes cheaper and more efficient, the competitive pressure amongst LLM providers increases – not on accuracy alone, but also on latency, uptime, and cost-per-token*.

What used to cost dollars can now cost pennies.

And what cost pennies may soon cost fractions of a cent...

*Cost-per-token = The expense incurred for processing or generating a single token (a word, sub-word, or character) during the operation of a language model. It is a key metric used to evaluate the computational efficiency and cost-effectiveness of deploying AI models, particularly in applications like natural language processing.

...The implications are still unfolding. For users (and developers), this shift is a gift: dramatically lower unit costs to access powerful AI.

And as end-user costs decline, creation of new products and services is flourishing, and user and usage adoption is rising.

For model providers, however, this raises real questions about monetization and profits.

Training is expensive, serving is getting cheap, and pricing power is slipping.

The business model is in flux. And there are new questions about the one-size-fits-all LLM approach, with smaller, cheaper models trained for custom use cases* now emerging.

Additionally, traditional business moats are being disrupted. Look no further than Google.

The company launched AI Overviews in May of last year – they sit above many Google search results. The company highlighted it had 1.5B AI Overviews MAUs as of 4/25...it's notable that in the last few weeks, Google began adding advertisements to select AI Overviews.

Will providers try to build horizontal platforms? Will they dive into specialized applications?

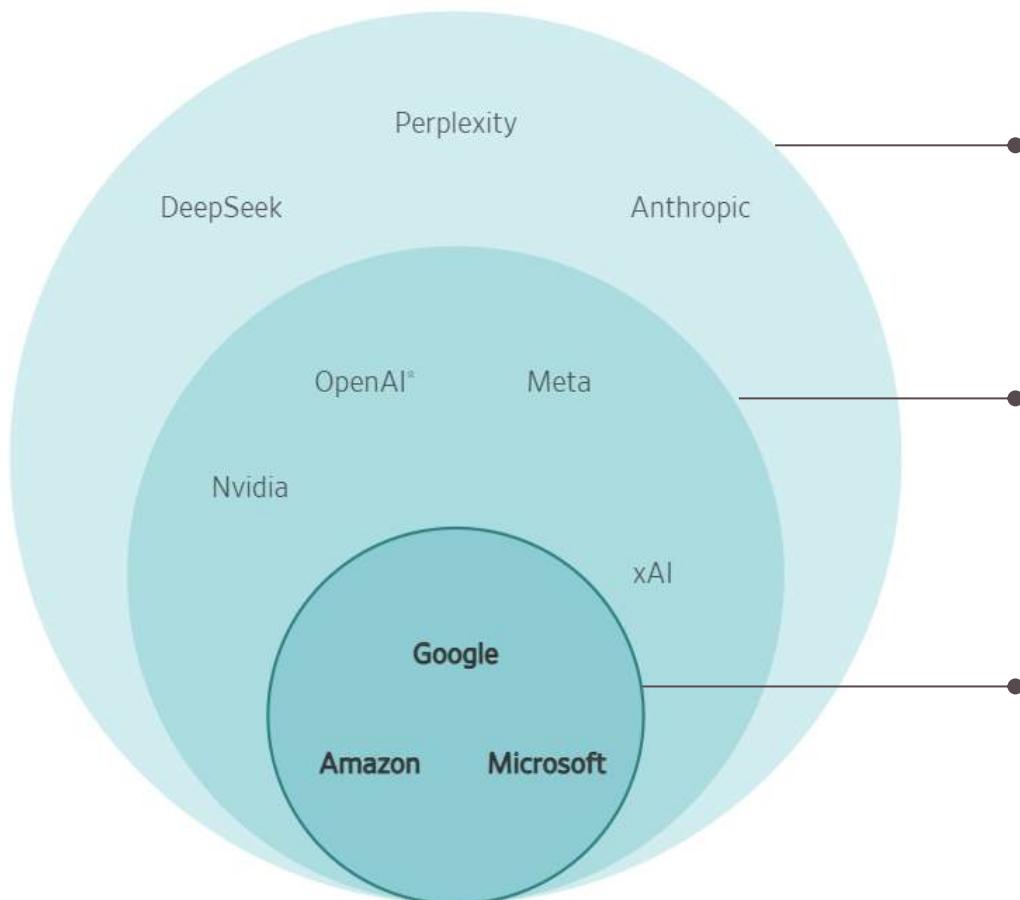

Will one or two leaders drive dominant user and usage share and related monetization, be it subscriptions (easily enabled by digital payment providers), digital services, ads, etc.?

Only time will tell. In the short term, it's hard to ignore that the economics of general-purpose LLMs look like commodity businesses with venture-scale burn.

AI Monetization – API & Generative Search = Anthropic Annualized Revenue +20x to \$2B in Eighteen Months

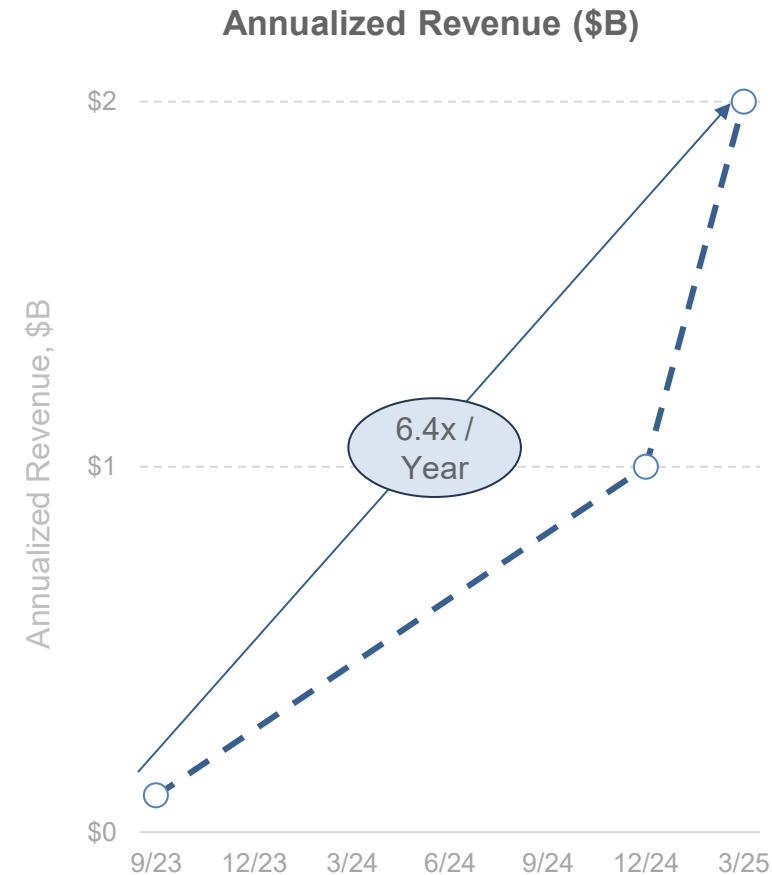

Anthropic: API & Generative Search – 9/23-3/25, per *Reuters, Bloomberg & CNBC*

We've developed Claude 3.7 Sonnet with a different philosophy from other reasoning models on the market. Just as humans use a single brain for both quick responses and deep reflection, we believe reasoning should be an integrated capability of frontier models rather than a separate model entirely. This unified approach also creates a more seamless experience for users...

...we've optimized somewhat less for math and computer science competition problems, and instead shifted focus towards real-world tasks that better reflect how businesses actually use LLMs.

- Anthropic Press Release, 2/25

Source: Anthropic; Reuters, 'Anthropic forecasts more than \$850 mln in annualized revenue rate by 2024-end – report' (12/23) ([link](#)); Bloomberg, 'Anthropic Finalizes Megaround at \$61.5 Billion Valuation' (3/25) ([link](#)); CNBC, 'Anthropic closes \$2.5 billion credit facility as Wall Street continues plunging money into AI boom' (5/25) ([link](#))

AI Monetization – Generative Search = Perplexity Annualized Revenue +7.6x to \$120MM in Fourteen Months

Perplexity: Generative Search – 3/24-5/25, per Perplexity & Bloomberg

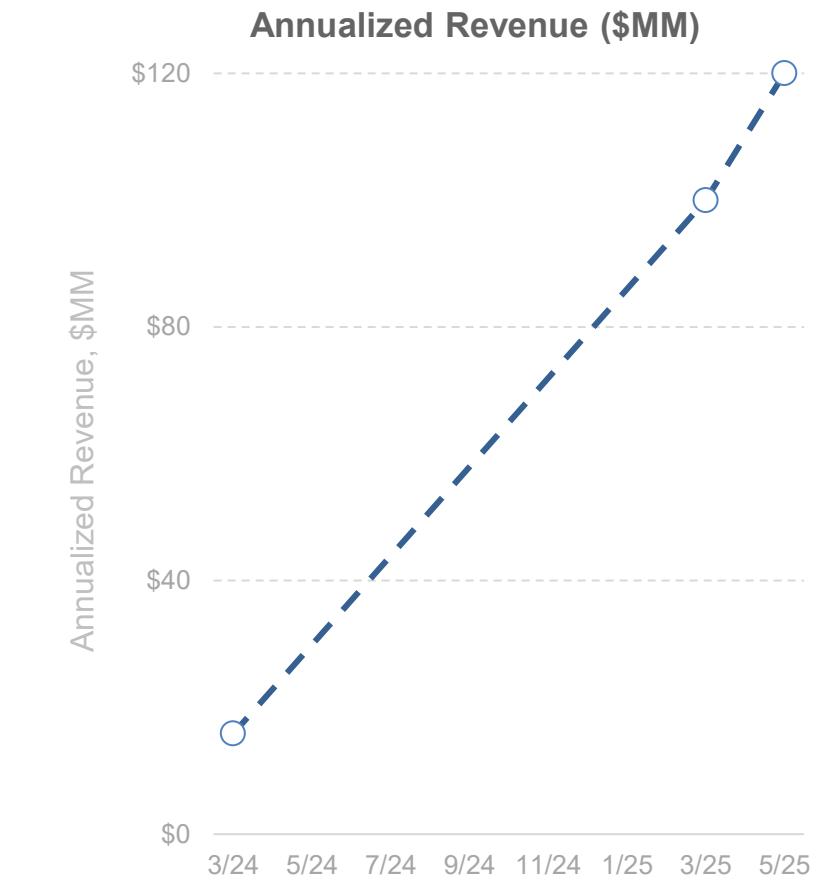

Perplexity is best described as an answer engine. You ask it a question, you get an answer. Except the difference is, all the answers are backed by sources. This is like how an academic writes a paper...What makes humans special is that we are creatures of curiosity. We need to expand on that and discover more knowledge using the power of AI.

- Perplexity Co-Founder & CEO Aravind Srinivas, 6/24

What if accessing information felt like talking to a personal research assistant?

- Perplexity Co-Founder & CEO Aravind Srinivas, 5/25

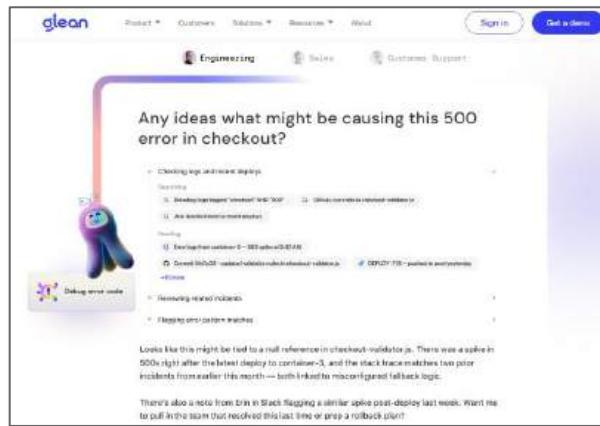

Note: 3/24 annualized revenue figure is an estimate per Perplexity Co-Founder & CEO Aravind Srinivas's 3/25 LinkedIn post saying 'Perplexity has crossed \$100m in annualized revenue...6.3x growth Y/Y and remains highly under monetized.'

Source: Lex Fridman Podcast (6/24), UC Berkeley (5/25), LinkedIn (3/25), Bloomberg, 'AI Startup Perplexity Nears Funding at \$14 Billion Value' (5/25) ([link](#))

AI Monetization – Enterprise Search + Agents = Glean Annualized Revenue +10x to \$100MM in Twenty-Four Months

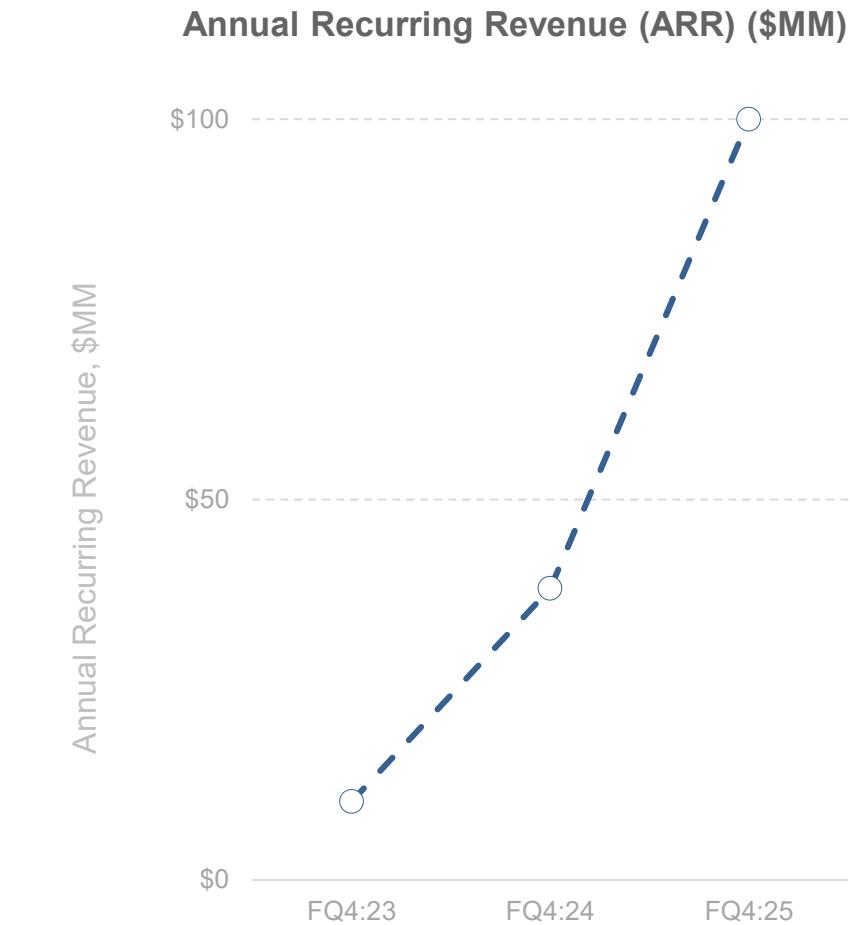

Glean – FQ4:23-FQ4:25, per Glean

We're honored to help some of the world's largest companies adopt AI to transform their businesses. To truly unlock new levels of creativity, productivity, and operational efficiency, AI needs to draw on the full picture of an organization's knowledge – and it needs to be accessible by everyone.

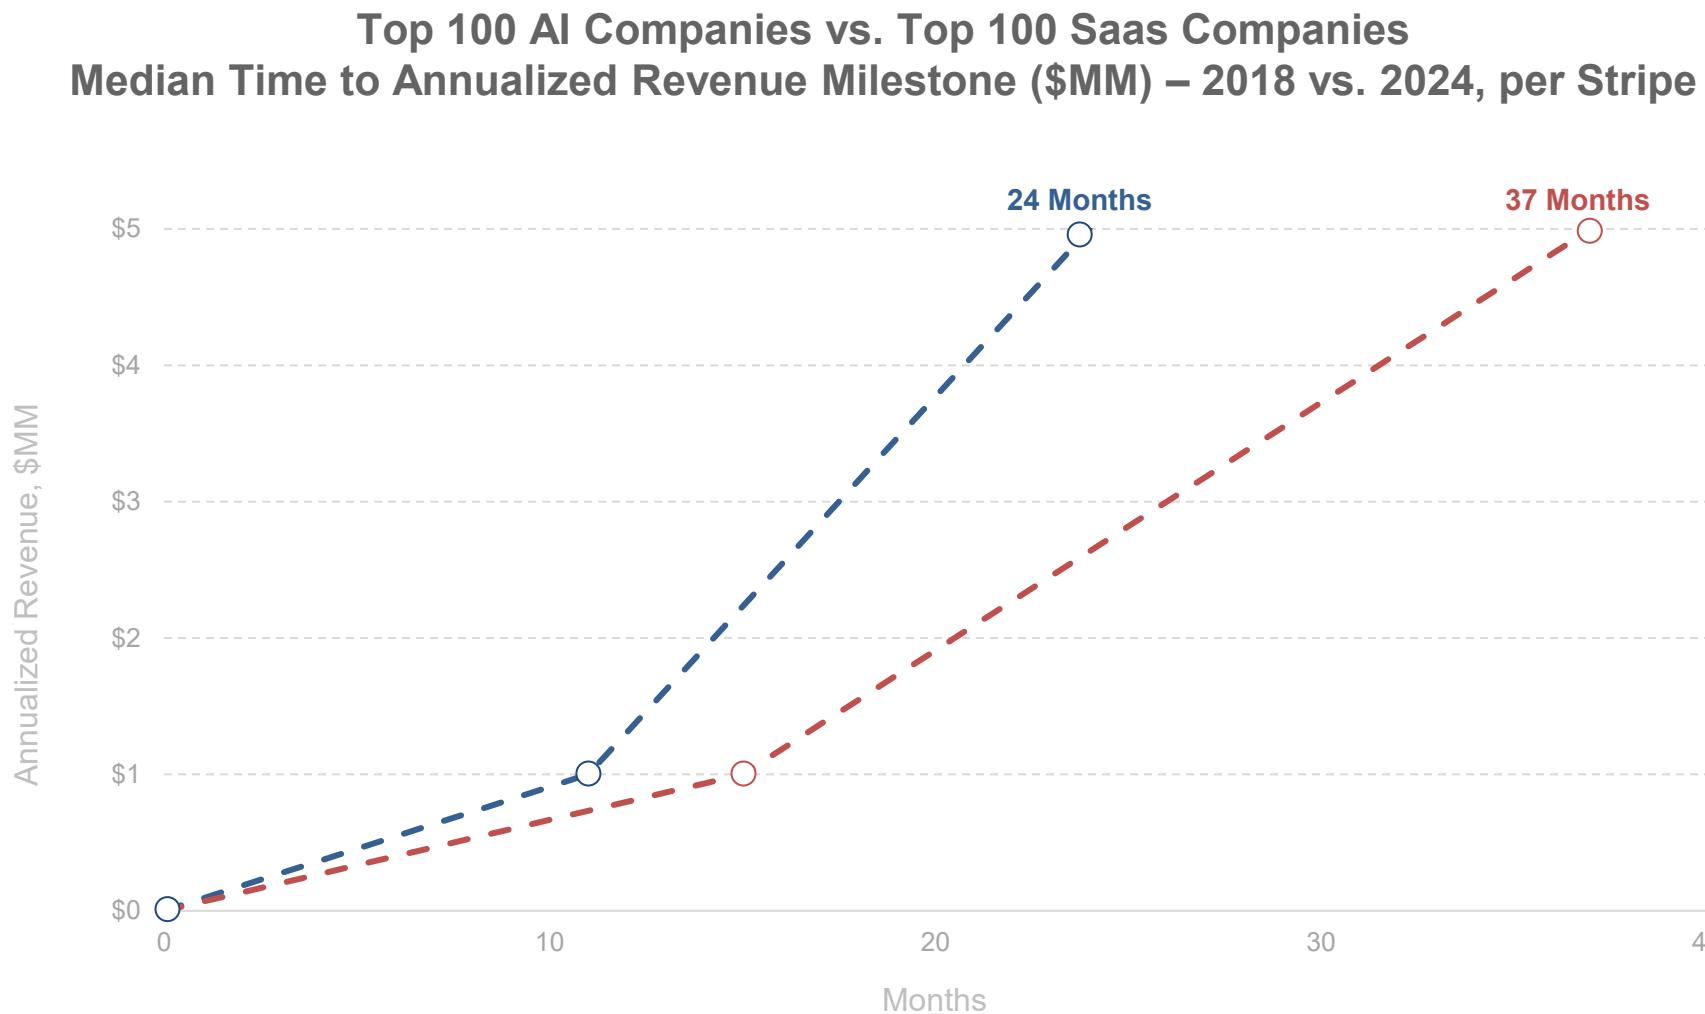

You shouldn't have to be a prompt engineering expert to find answers, generate content, and automate work with AI.

- Glean Co-Founder & CEO Arvind Jain (9/24)

Note: Glean's fiscal year ends in January. Source: Glean (2/25, 11/24)

Tech Incumbent AI Rollouts = Spotify – AI DJ (2/23)

Spotify AI DJ – 2/23-5/25, per Spotify

AI DJ and music videos...are truly moving averages...

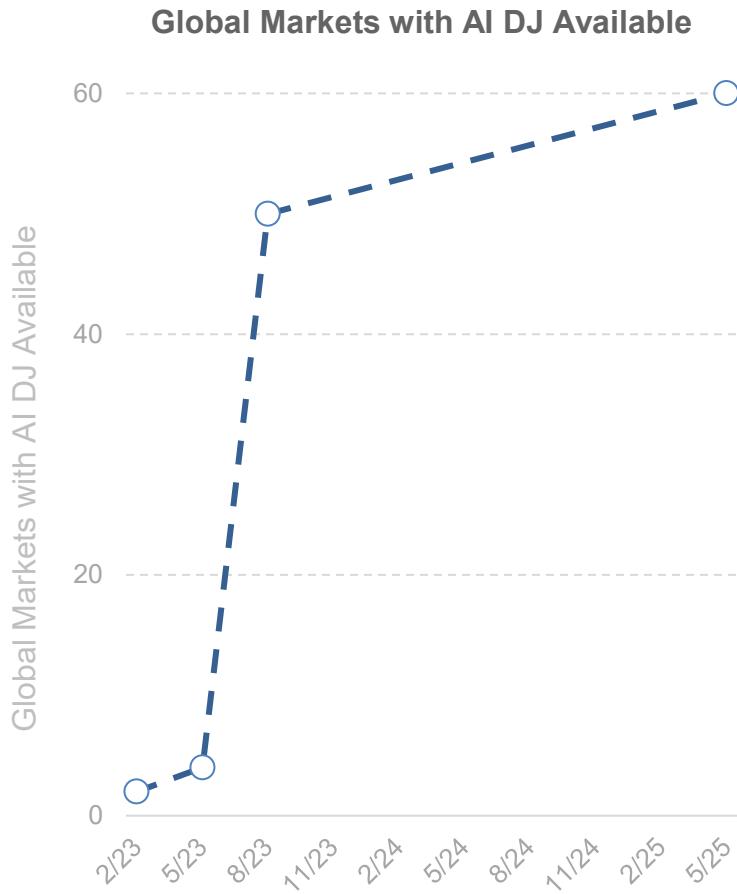

*AI DJ, we're seeing amazing results,
not just on quantitative metrics, but also on
quality metrics, how people feel about Spotify,
what they say they love about Spotify.*

- Spotify Co-Founder & CEO Daniel Ek, 11/24

*Back in 2018, we said something internally that still
holds true today: machine learning – what most people
called AI back then – was the product...*

*AI is really the next step in evolution,
where machine learning allows personalization,
AI also allows for real time interactivity and
reasoning on top of your data.*

**- Spotify Co-President, Chief Product &
Technology Officer Gustav Söderström, 4/25**

Source: Company announcements (2/23, 5/23, 8/23, 11/24, 4/25, 5/25)

Tech Incumbent AI Rollouts = Microsoft – Copilot (2/23)

Microsoft: Copilot – 8/23-12/24, per Microsoft

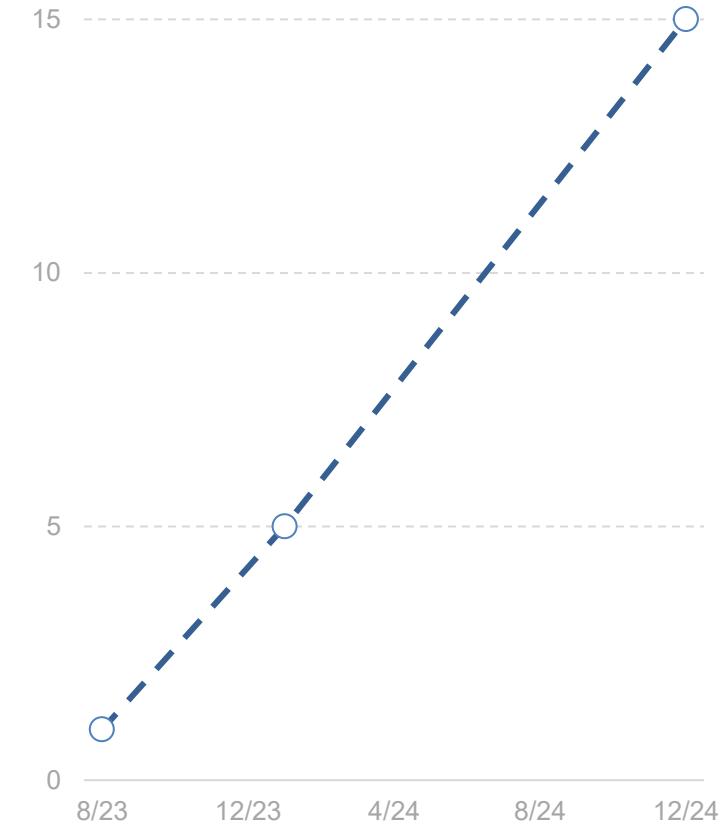

To empower people to unlock the joy of discovery, feel the wonder of creation and better harness the world's knowledge, today we're improving how the world benefits from the web by reinventing the tools billions of people use every day, the search engine and the browser.

Today, we're launching an all new, AI-powered Bing search engine and Edge browser, available in preview now at Bing.com, to deliver better search, more complete answers, a new chat experience and the ability to generate content. We think of these tools as an AI copilot for the web.

- Official Microsoft Blog, 2/23

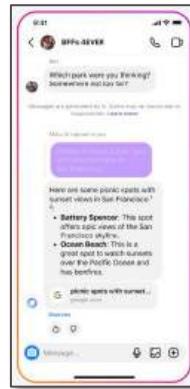

Microsoft Copilot Cumulative Chats Held (B)

Note: We assume zero users in the launch month. We assume 15B cumulative chats as of 12/24 due to Microsoft's 1/24 announcement of 5B cumulative chats, and 12/24 announcement of 10B more chats being held in 2024. We assume the Verge's announcement of 'There have also been over 1 billion chats on Bing Chat' as of 8/23 is wholly inclusive of Copilot chat volumes as of that date. Source: Microsoft announcements & earnings reports, The Verge citing Microsoft disclosures (8/23)

Tech Incumbent AI Rollouts = Meta Platforms – Meta AI (9/23)

Meta Platforms: Meta AI – 11/23-4/25, per Meta Platforms

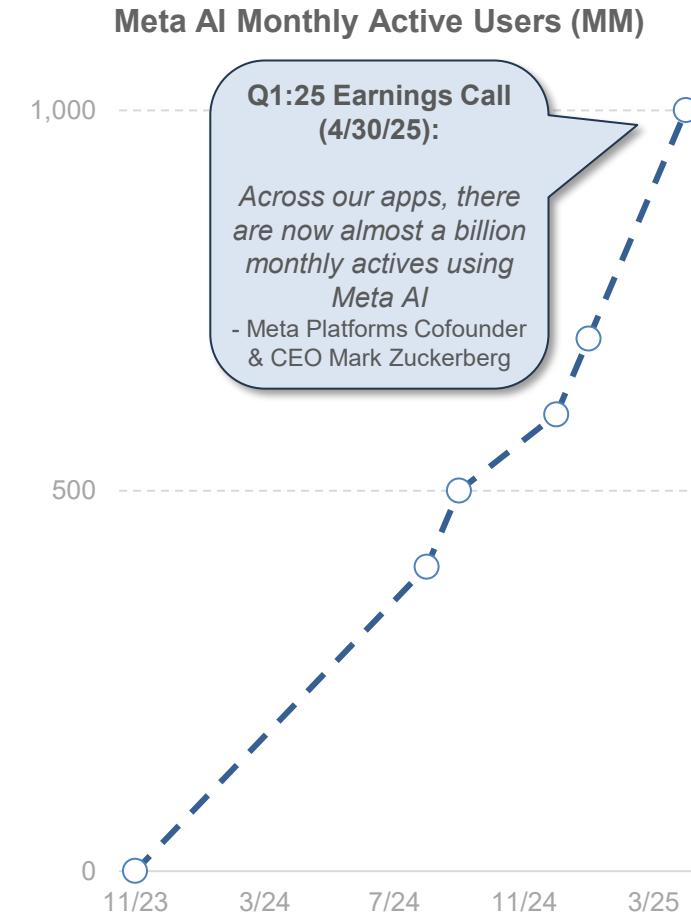

I expect that this is going to be the year when a highly intelligent and personalized AI assistant reaches more than 1 billion people, and I expect Meta AI to be that leading AI assistant. Meta AI is already used by more people than any other assistant...

...I also expect that 2025 will be the year when it becomes possible to build an AI engineering agent that has coding and problem-solving abilities of around a good mid-level engineer...

...Whichever company builds [a high-skill AI engineering agent] first, I think it's going to have a meaningful advantage in deploying it to advance their AI research and shape the field.

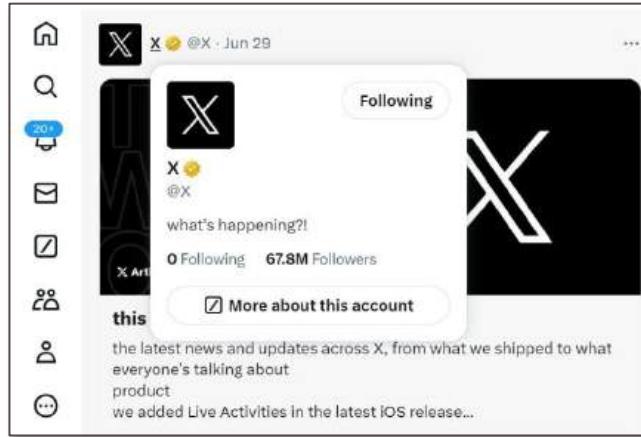

- Meta Platforms CEO Mark Zuckerberg, 1/25

Note: We assume zero users in 11/23 per Meta's 12/23 blog post noting, 'To chat with our AIs, start a new message and select "Create an AI chat" on Instagram, Messenger or WhatsApp. They're now available to anyone in the US.' Source: Meta Platforms announcements & earnings reports

Tech Incumbent AI Rollouts = X – Grok (11/23)

X: Grok – 12/24-4/25, per xAI & Similarweb

The mission of xAI and Grok is to understand the universe.
We want to answer the biggest questions.

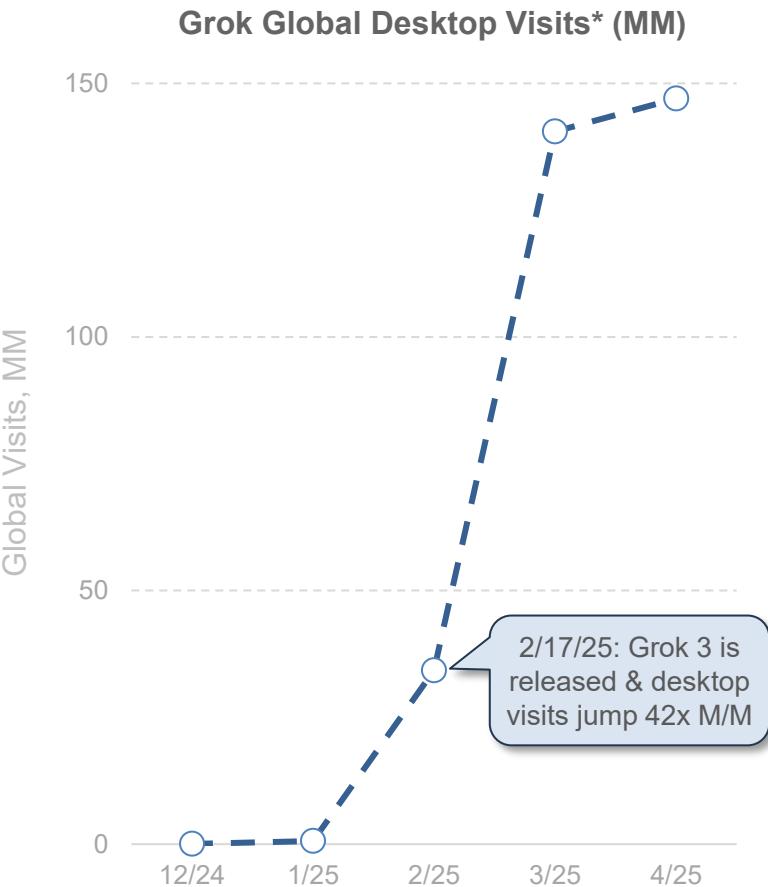

- xAI Founder & CEO Elon Musk, 2/25

AI with Grok is getting very good...it's important that AI be programmed with good values, especially truth-seeking values. This is, I think, essential for AI safety...

...Remember these words: We must have a maximally truth-seeking AI.

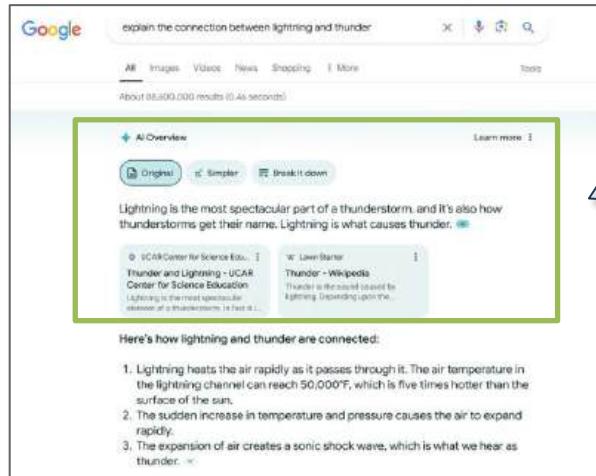

- xAI Founder & CEO Elon Musk, 5/25

Tech Incumbent AI Rollouts = Google – Gemini & AI Overviews (12/23)

Alphabet: Gemini & AI Overviews – 3/25-5/25, per Alphabet & *Business Insider*

AI Overviews embedded in Google Search; @ 1.5B MAUs (4/25)

Our differentiated, full stack approach to AI continues to be central to our growth. This quarter was super exciting as we rolled out Gemini 2.5, our most intelligent AI model, which is achieving breakthroughs in performance, and it's widely recognized as the best model in the industry.

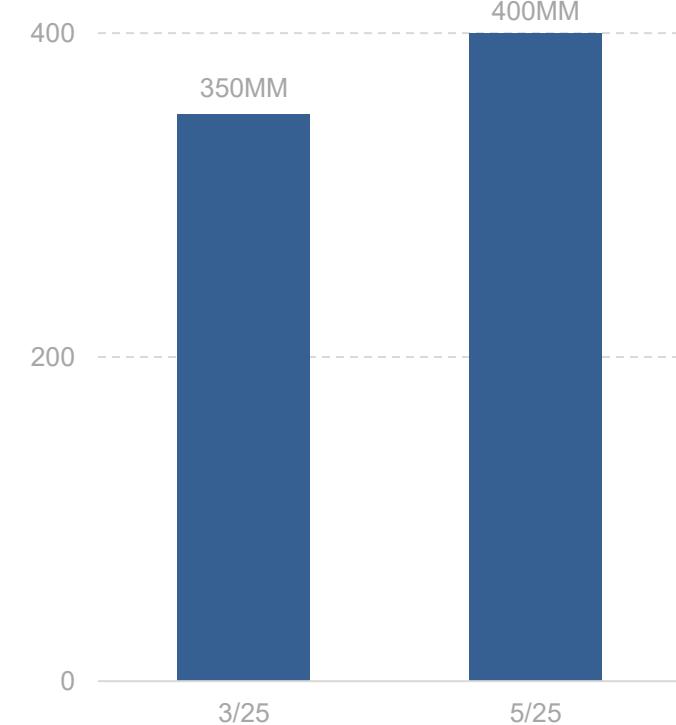

- Alphabet CEO Sundar Pichai, 4/25

Google Gemini is a family of multimodal AI models, capable of understanding and generating various types of data including text, code, audio, images, and video.

Source: Google Gemini

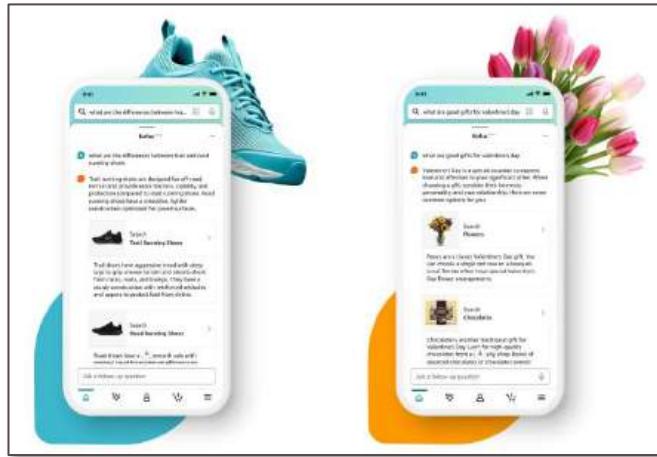

*Note: Gemini launched 12/23...App launched 2/24. Data shown for apps in Gemini ecosystem. User counts may differ from those as measured by third-party data providers / panels like Similarweb & Sensor Tower as they measure only visits to desktop sites and standalone mobile apps, respectively. Source: Google announcements (4/25 & 5/25) & *Business Insider*, 'Google's Gemini usage is skyrocketing, but rivals like ChatGPT and Meta AI are still blowing it out of the water' (4/25)*

Gemini Chatbot Global MAUs (MM)

Tech Incumbent AI Rollouts = Amazon – Rufus (2/24)

Amazon: Rufus – 12/22-3/25, per Amazon & Morgan Stanley Estimates

We have so many customers now who just use Rufus to help them find a quick fact about a product. They also use Rufus to figure out how to summarize customer reviews, so they don't have to read 100 customer reviews to get a sense of what people think about that product...the personalization keeps getting much better...

...And so, we expect throughout 2025, that the number of occasions where you're not sure what you want to buy and you want help from Rufus are going to continue to increase and be more and more helpful to customers.

- Amazon CEO Andy Jassy, 2/25

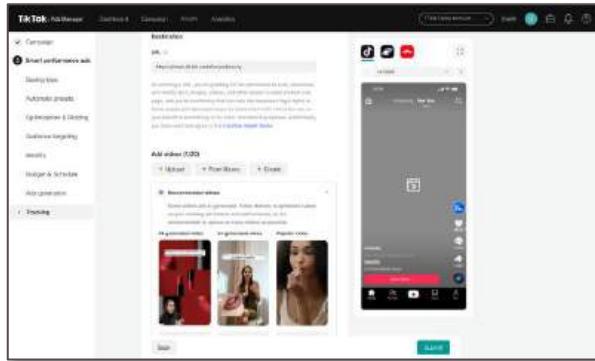

Amazon North America Retail Estimated Gross Merchandise Value (\$B), Last 12 Months

Source: Amazon; Morgan Stanley estimates

Tech Incumbent AI Rollouts = TikTok – Symphony AI Assistant (6/24)

TikTok: Symphony Assistant – 1/24-4/25, per TikTok & Similarweb

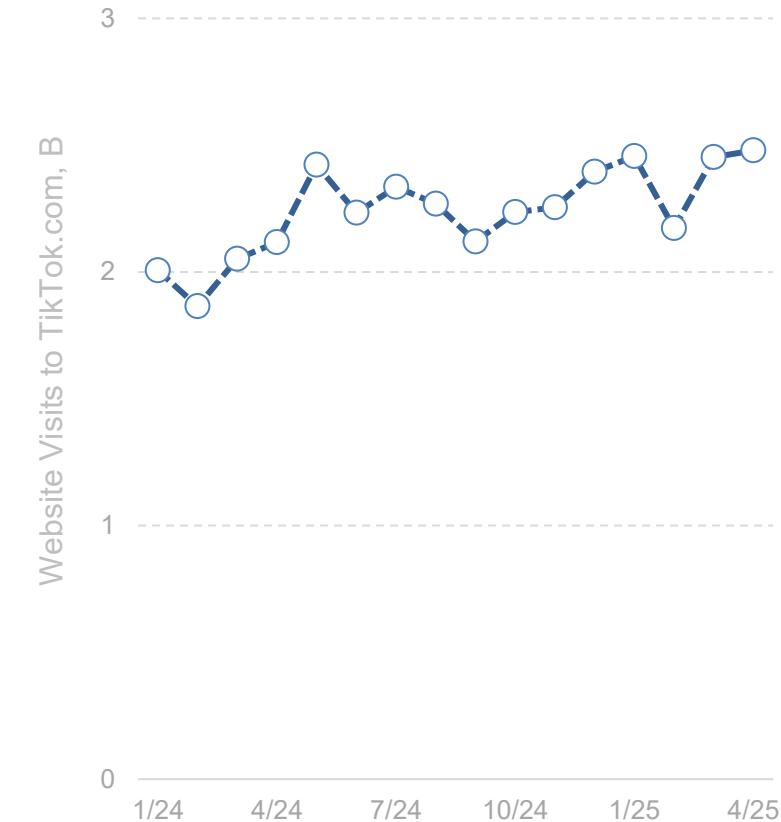

Creativity thrives on TikTok. When brands truly lean into creative bravery and experimentation, they are able to speak directly to their community and invite them to join in the conversation. At TikTok World 2024 we launched Symphony, our suite of ad solutions powered by generative AI...

...With Symphony, businesses of all sizes, creators and agencies can blend human imagination with AI-powered efficiency to help scale content development, creativity, and productivity on TikTok. Research has proven that not only does creating TikTok-first ads boost purchase intent by +37% and brand favorability by +38%, but also 79% of TikTok users show a preference for brands that demonstrate a clear understanding of how to create content specifically for the platform.

- TikTok Press Release, 6/24

Note: Includes both mobile & desktop website visits. China data may be subject to informational limitations due to government restrictions.
Source: TikTok; Similarweb (5/25)

Global Website Visits to TikTok.com (B)
(Where Symphony Assistant is Hosted)

Tech Incumbent AI Rollouts = Apple – Apple Intelligence (10/24)

Apple: Apple Intelligence – 9/23-3/25, per Apple & IDC Estimates

Apple Intelligence builds on years of innovations we've made across hardware and software to transform how users experience our products. Apple Intelligence also empowers users by delivering personal context that's relevant to them.

And importantly, Apple Intelligence is a breakthrough for privacy and AI with innovations like private cloud compute...

...[in] the markets where we had rolled out Apple Intelligence...year over year performance on the iPhone 16 family was stronger than those where Apple Intelligence was not available.

- Apple CEO Tim Cook, 1/25

Estimated Global Sales of iPhone 15 Pro / Pro Max & iPhone 16 (MM) – 9/23-3/25 Apple Intelligence-Capable Devices

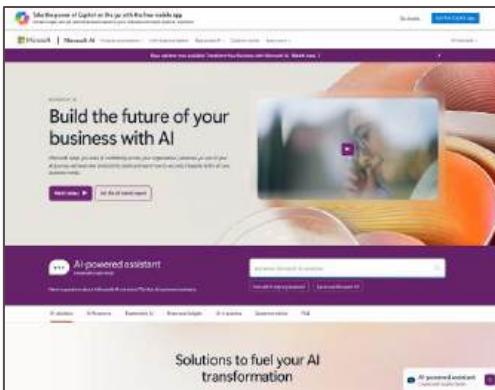

*Note: Counts sales of iPhone 15 Pro, iPhone 15 Pro Max, & iPhone 16 devices. Figures are estimates.

AI – Tech Incumbents =

Rapid Revenue + Customer Growth

AI Monetization – ‘AI Product’ = Microsoft AI Revenue +175% to \$13B Y/Y

Microsoft AI Product Revenue – 2023-2024, per Microsoft

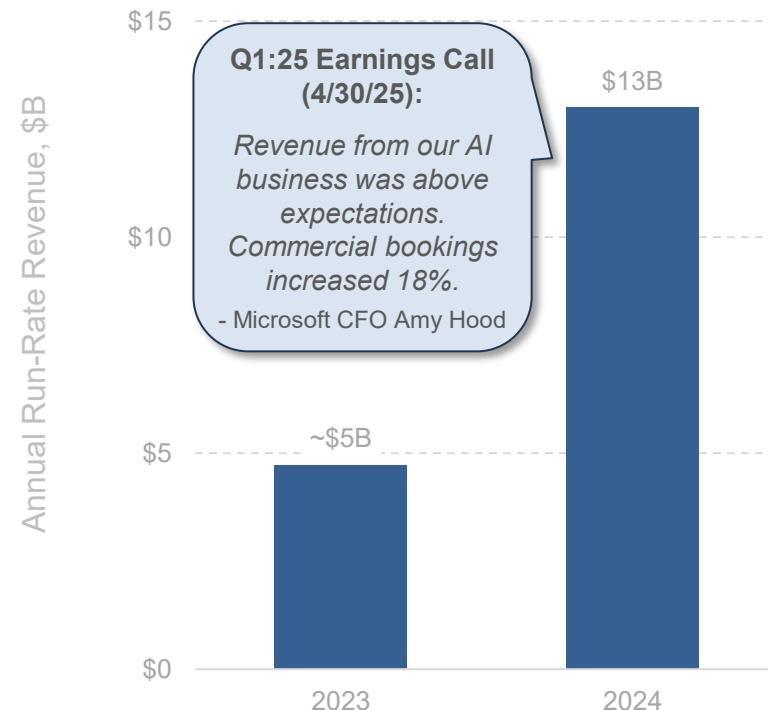

We are innovating across our tech stack and helping customers unlock the full ROI of AI to capture the massive opportunity ahead...

...Already, our AI business has surpassed an annual revenue run rate of \$13 billion, up 175% year-over-year.

- Microsoft CEO Satya Nadella, 1/25

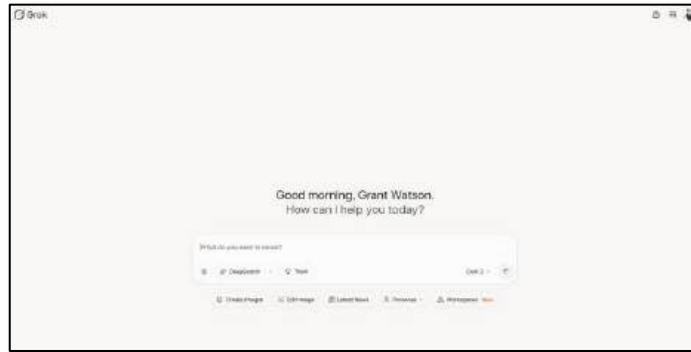

Estimated Microsoft AI Product Annual Run-Rate Revenue (\$B)

Note: Microsoft AI revenue likely includes Azure AI services, Microsoft 365 Copilot, GitHub Copilot, Dynamics 365 Copilot, Azure OpenAI Services, and others. Detailed breakdowns not provided on earnings calls. Source: Microsoft Press Release, ‘Microsoft Cloud and AI strength drives second quarter results’ (1/25); & other Microsoft announcements

AI Monetization – Generative Search = xAI Annualized Revenue Up Materially in 2025

xAI: Generative Search, per xAI & *The Wall Street Journal*

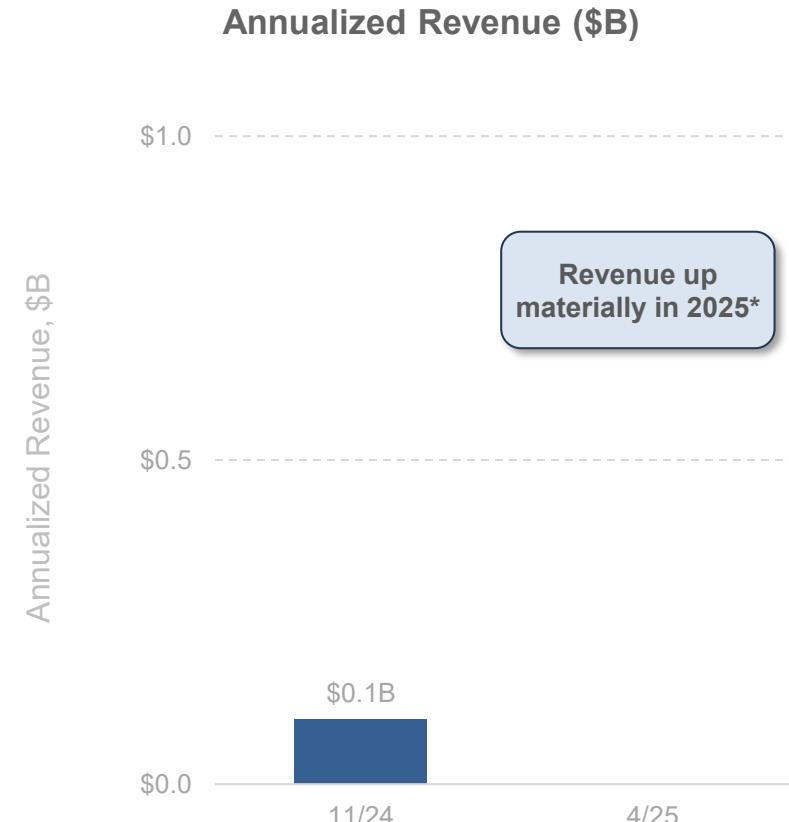

We are pleased to introduce Grok 3, our most advanced model yet: blending strong reasoning with extensive pretraining knowledge. Trained on our Colossus supercluster with 10x the compute of previous state-of-the-art models, Grok 3 displays significant improvements in reasoning, mathematics, coding, world knowledge, and instruction-following tasks.

- xAI Grok 3 Press Release, 2/25

[Grok is a] maximally truth-seeking AI, even if that truth is sometimes at odds with what is politically correct.

- xAI Founder & CEO Elon Musk, 2/25

*Select media reports have xAI revenue being as high as \$1B as of 4/25. Source: xAI (2/25); The Wall Street Journal, 'Elon Musk's xAI Startup Is Valued at \$50 Billion in New Funding Round' (11/24) ([link](#)); CNBC, 'Musk says he's looking to put 'proper value' on xAI during investor call, sources say' (4/25) ([link](#))

AI Monetization – AI Services = Palantir USA Commercial Customers +65% to 432 Y/Y

Palantir USA Commercial Customers – Q1:23-Q1:25, per Palantir

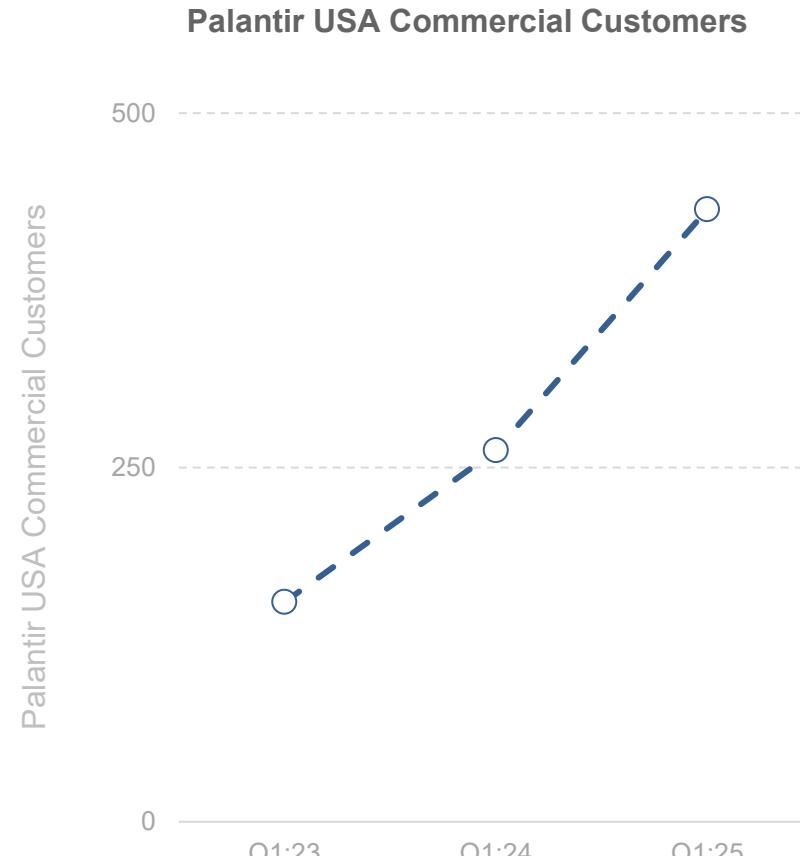

We achieved a \$1 billion annual run rate in our US commercial business for the first time as AIP [Artificial Intelligence Platform] continues to drive both new customer conversions and existing customer expansions in the US..

- Palantir CFO David Glazer , 5/25

As AI models progress and improve, we continue enabling our customers to maximally leverage these models in production, capitalizing upon the rich context within the enterprise through the Ontology. We remain differentiated in our elite execution to deliver quantified exceptionalism for our customers, ever widening their advantage over the AI have-nots.

- Palantir CRO & Chief Legal Officer Ryan Taylor, 5/25

AI Monetization Possibilities – Enterprise =

Horizontal Platform
& / Or
Specialized Software?

To understand where enterprise AI monetization is headed, it helps to ask where software itself is consolidating.

For decades, business software followed a familiar pattern: build a specialized tool, sell it to a narrow user base, and scale up within a vertical. This was the age of vertical SaaS – Toast for restaurants, Guidewire for insurance, Veeva for life sciences...Each tool solved a deep, narrow problem. But with the rise of foundation models and generative AI, others are gunning for these prizes.

Enter the horizontal enterprise platforms – horizontal layers that combines AI-native productivity, search, communication, and knowledge management into one unified interface. Think of it as Slack meets Notion meets ChatGPT, all in one platform.

Horizontal enterprise platforms could usher in a new form of monetization: not by selling siloed software licenses, but by charging for intelligence, embedded throughout the stack. The value shifts from tools to outcomes – from CRMs to automated deal summaries, from service desks to AI-powered resolution flows.

These horizontal capabilities are still early, but they're already being harnessed by incumbents and upstarts alike. Microsoft is integrating Copilot across the stack.

Zoom and Canva are layering GenAI into user-facing workflows, while Databricks is infusing GenAI into its data and developer stack. Meanwhile, startups like Glean are betting on AI-first workflows to challenge the suite model...

...But specialist vendors aren't standing still. If anything, they're absorbing AI faster – embedding copilots, automating workflows, and fine-tuning models on proprietary industry data. These platforms already have the workflows, the trust, and the structured data that AI thrives on. That gives them a head start in deploying domain-specific intelligence –

AI that doesn't just summarize a meeting, but flags regulatory risks, optimizes pricing in real time, or drafts FDA-compliant documentation. In many cases, their incumbency becomes their advantage: they can roll out AI as a feature, not a product, and monetize it without changing the buying motion.

The next chapter of AI monetization may not be a winner-take-all battle, but a convergence. Horizontal platforms will push breadth, stitching together knowledge across functions; specialists will push depth, delivering AI that speaks the language of compliance, contracts, and customer intent.

The question isn't whether platforms or specialists win – it's who can abstract the right layer, own the interface, and capture the logic of work itself. In the AI era, monetization won't just follow usage – it will follow attention, context, and control.

Enterprise SaaS Incumbent AI Rollouts = Microsoft GitHub Copilot – 6/22

Microsoft GitHub Copilot – 6/17-6/24, per GitHub, Microsoft & Wells Fargo

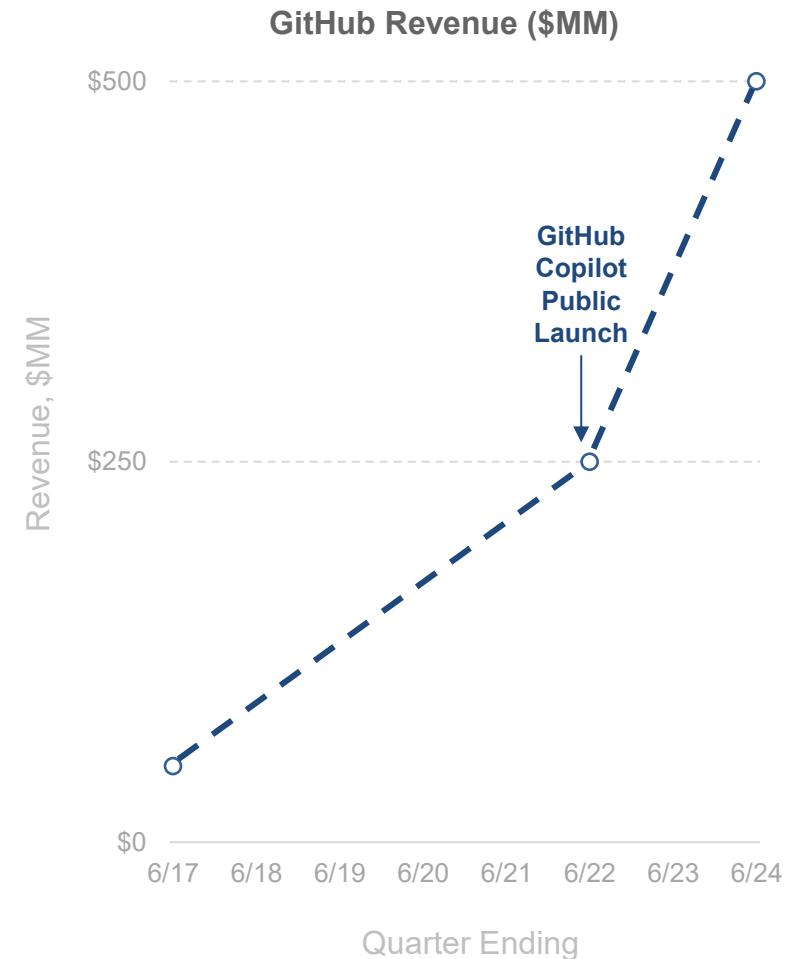

GitHub Copilot is by far the most widely adopted AI-powered developer tool. Just over two years since its general availability, more than 77,000 organizations – from BBVA, FedEx, and H&M, to Infosys and Paytm – have adopted Copilot, up 180% year-over-year.

- Microsoft CEO Satya Nadella, 7/24

We have been delighted by the early response to GitHub Copilot and vs. Code with more than 1 million sign-ups in just the first week post launch. All up, GitHub now is home to 150 million developers, up 50% over the past two years.

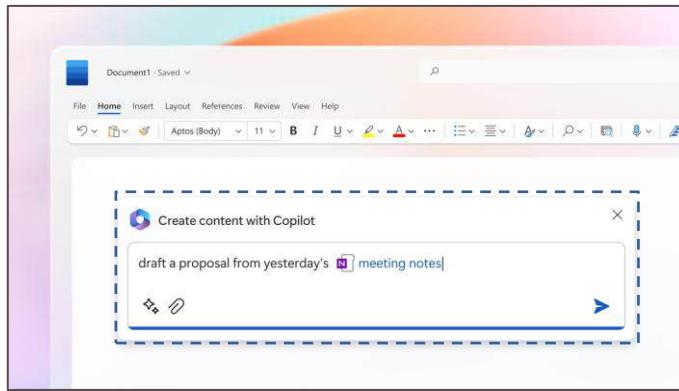

- Microsoft CEO Satya Nadella, 1/25

Note: GitHub revenue is disclosed irregularly; 3 datapoints are from company leadership's disclosures. Public developer launch date shown. GitHub reports annualized revenue; here, we translate this to quarterly revenue. Source: Company announcements & investor filings

Enterprise SaaS Incumbent AI Rollouts = Microsoft 365 Copilot – 3/23

Microsoft 365 Copilot – Q2:23-Q4:24, per Microsoft & Morgan Stanley

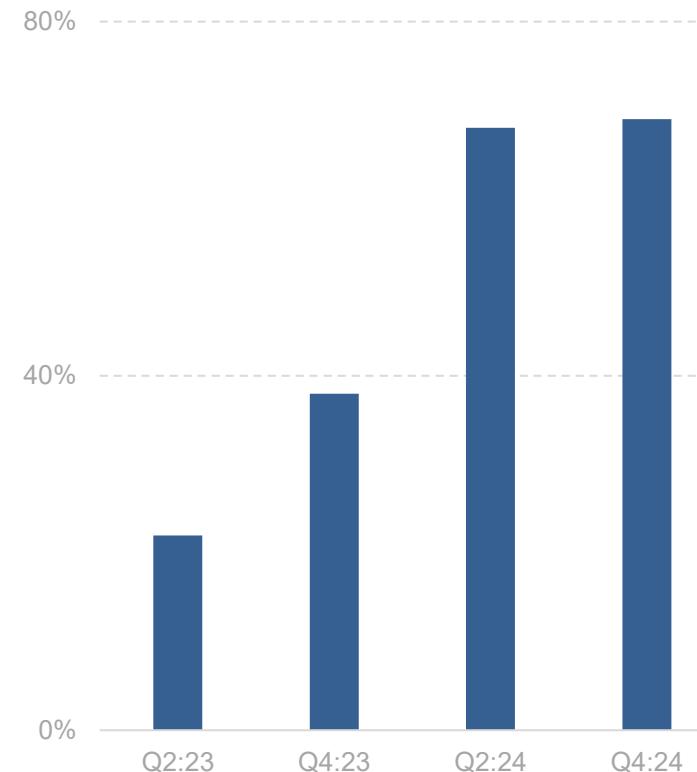

We are seeing accelerated customer adoption across all deal sizes as we win new Microsoft 365 Copilot customers and see the majority of existing enterprise customers come back to purchase more seats. When you look at customers who purchased Copilot during the first quarter of availability, they have expanded their seat collectively by more than 10x over the past 18 months. And overall, the number of people who use Copilot daily, again, more than doubled quarter over quarter.

Employees are also engaging with Copilot more than ever. Usage intensity increased more than 60% quarter over quarter, and we are expanding our TAM with Copilot Chat, which was announced earlier this month.

- Microsoft CEO Satya Nadella, 1/25

% of CIOs Expecting to Use Microsoft 365 Copilot over Next 12 Months, per Morgan Stanley Survey

Note: N=61 CIOs in the USA & EU. Microsoft 365 Copilot was announced in 3/23 but was not made generally available for enterprise customers until 11/23. Enterprise SaaS Incumbent AI Rollouts = Adobe Firefly – 3/23

Adobe Firefly – 5/23-4/25, per Adobe

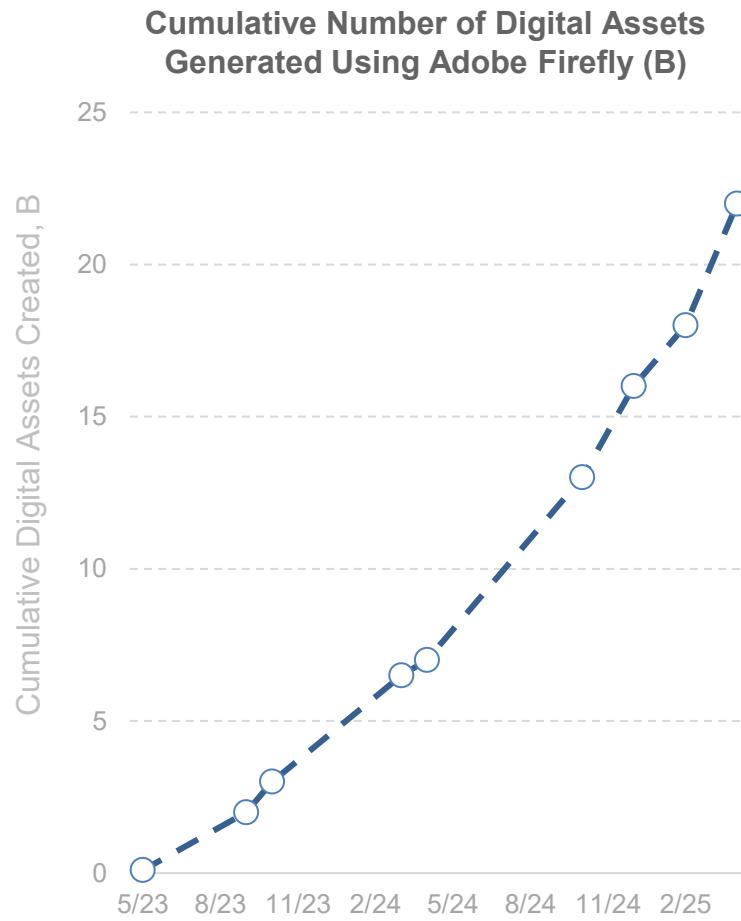

The release of the Adobe FireFly video model in February, a commercially safe generative AI video model, has been very positively received by brands and creative professionals...

...User engagement has been strong with over 90% of paid users generating videos...

...We're delighted with the early interest in these new offerings. Other creative professional and creator highlights include, continued strong adoption of GenAI in our products with Photoshop GenAI monthly active users at approximately 35% and Lightroom GenAI monthly active users at 30%. Users have generated over 20 billion assets with Firefly.

- Adobe President of Digital Media David Wadhwani, 3/25

Note: We assume zero users in the launch month. Adobe Firefly was released as a public beta in March 2023.

Source: Adobe announcements (9/23, 10/23, 3/24, 4/24, 10/24, 12/24, 2/25)

Enterprise SaaS Incumbent AI Rollouts = Atlassian Intelligence – 4/23

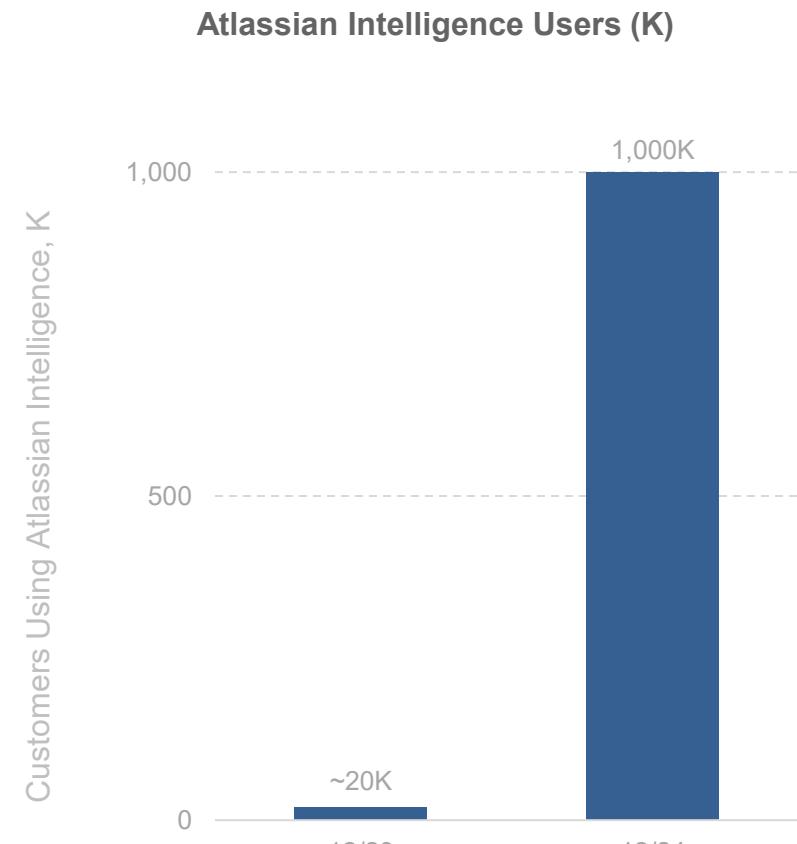

Atlassian Intelligence – 12/23-12/24, per Atlassian

Today, more than 1 million monthly active users are utilizing our Atlassian intelligence features to unlock enterprise knowledge, supercharge workflows, and accelerate their team collaboration. These features are clearly delivering value as we've seen a number of AI interactions increase more than 25x year over year...

...Atlassian Intelligence [saw a] 25x improvement in the number of features used over the last year.

- Atlassian Co-Founder & Co-CEO Michael Cannon, 2/25

Note: 12/23 users includes beta users. We assume 20,000 users based on Atlassian's disclosure that 'Nearly 10% of Atlassian's 265,000+ customers have already leveraged Atlassian Intelligence through our beta program.' Source: Atlassian announcements (4/23, 12/23, 12/24)

Enterprise SaaS Incumbent AI Rollouts = Zoom AI Companion – 9/23

Zoom AI Companion – 9/23-12/24, per Zoom

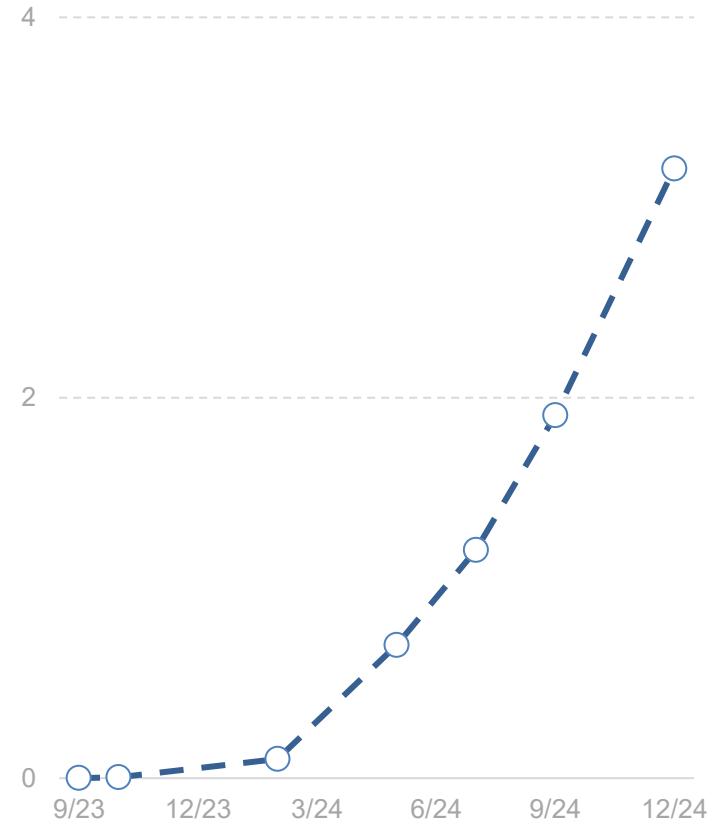

Growth in monthly active users of Zoom AI Companion accelerated to 68% quarter over quarter, demonstrating the real value AI is providing customers.

Zoom AI Companion has emerged as a driving force behind our transformation into an AI-first company...

...As part of AI Companion 2.0, we added advanced agentic capabilities, including memory, reasoning, orchestration, and seamless integration with Microsoft and Google services.

- Zoom Founder & CEO Eric Yuan, 2/25

Estimated Zoom Accounts with AI Companion Activated (MM)

Note: AI Companion MAUs are estimates based on company disclosures. As of 7/30/24, Zoom disclosed they had 1.2MM accounts with AI Companion activated. In Q3 2024, they disclosed 59% Q/Q growth in active accounts; in Q4 2024, they disclosed further 68% Q/Q growth. We assume zero users in the launch month.

Source: Zoom announcements (9/23, 10/23, 2/24, 5/24, 7/24, 9/24, 12/24)

Enterprise SaaS Incumbent AI Rollouts = Canva Magic Studio – 10/23

Canva Magic Studio – 10/23-5/25, per Canva

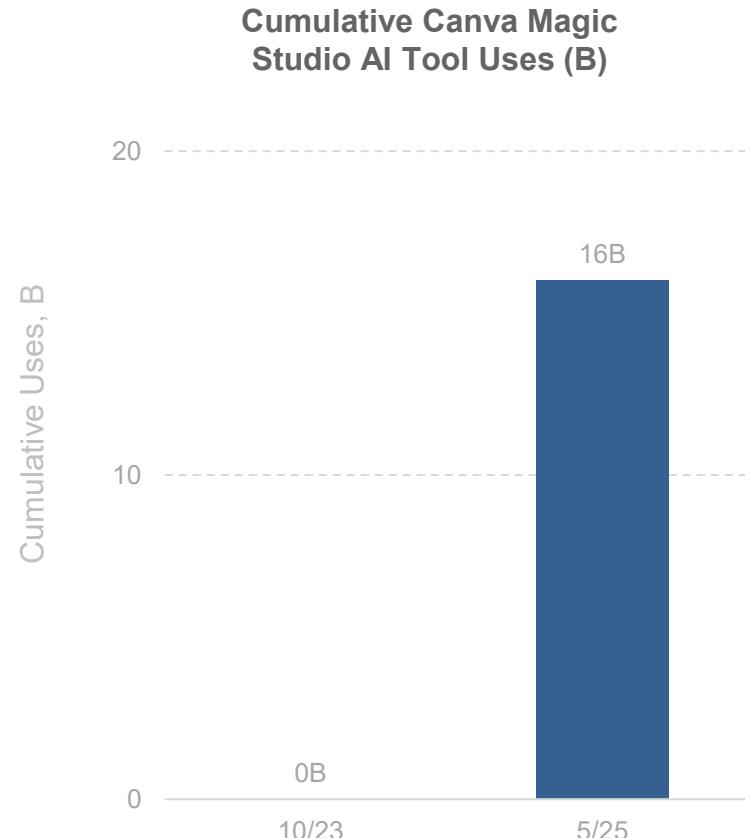

With Magic Studio there's no need to toggle between multiple AI tools or learn lots of different software – all the best of AI is at your fingertips. Created for the 99% of the world without complex design skills, Magic Studio is jam-packed with easy-to-use AI-powered features across every part of Canva to help you work smarter.

- Canva Press Release, 10/23

Magic Studio is designed to supercharge creativity across our entire community – from enterprise teams to educators and nonprofits. Its easy-to-use AI features are woven into every part of Canva, enabling anyone to spark inspiration, streamline workflows, and scale their content. In fact, our AI tools have been used more than 10 billion times to date.

- Canva Press Release, 10/24

Note: We assume zero users in the launch month. Source: Canva announcements (10/23, 10/24, 5/25)

Enterprise SaaS Incumbent AI Rollouts = Salesforce Agentforce – 9/24

Salesforce Agentforce – 12/24-2/25, per Salesforce

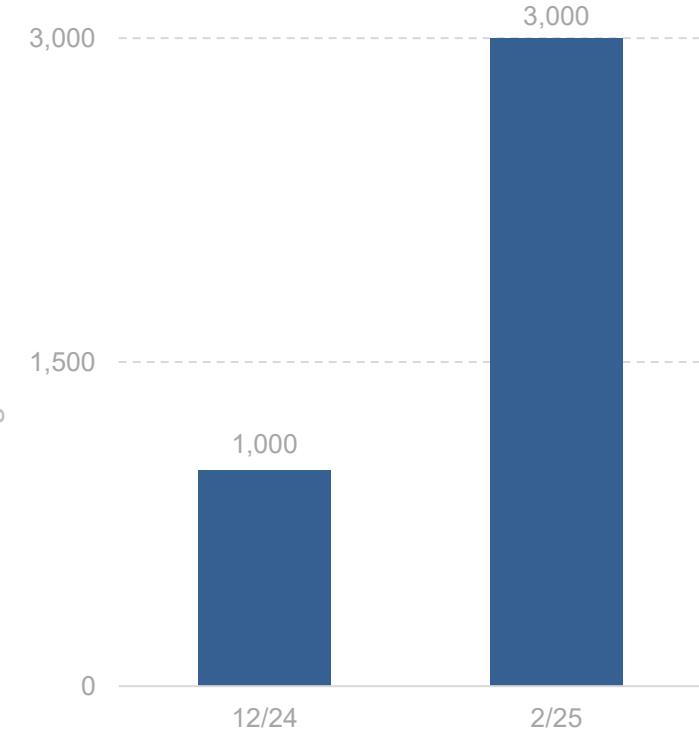

We ended this year with \$900MM in Data Cloud and AI ARR. It grew 120% year over year. We've never seen products grow at these levels, especially Agentforce...

...Just 90 days after it went live, we've already had 3,000 paying Agentforce customers who are experiencing unprecedented levels of productivity, efficiency, and cost savings...

...Data Cloud is the fuel that powers Agentforce and our customers are investing in it. And Data Cloud surpassed 50 trillion, that's trillion with a T, records, doubling year over year as customers increase their consumption and investment in our data platform.

- Salesforce Co-Founder & CEO Mark Benioff, 2/25

Number of Paid Agentforce Deals Signed

Note: Agentforce was announced on 9/12/24 but became generally available on 10/29/24. We assume zero users in the launch month.

...OpenAI ChatGPT = Potential Horizontal Enterprise Platform?

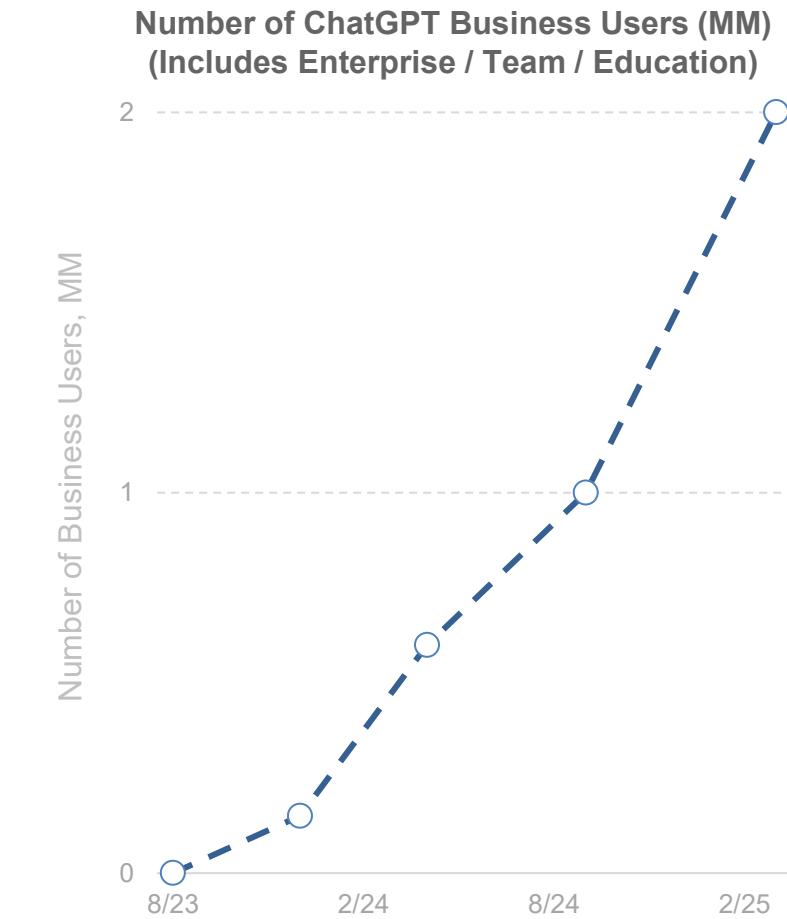

ChatGPT Enterprise – 8/23-3/25, per OpenAI, Bloomberg, Reuters, & The Wall Street Journal

Since ChatGPT's launch just nine months ago, we've seen teams adopt it in over 80% of Fortune 500 companies. We've heard from business leaders that they'd like a simple and safe way of deploying it in their organization. Early users of ChatGPT Enterprise...are redefining how they operate and are using ChatGPT to craft clearer communications, accelerate coding tasks, rapidly explore answers to complex business questions, assist with creative work, and much more.

ChatGPT Enterprise removes all usage caps and performs up to two times faster [vs. ChatGPT Free]...
...ChatGPT Enterprise also provides unlimited access to advanced data analysis, previously known as Code Interpreter.

Software Engineering

Specialized AI – Software Engineering (Code Editor) = Anysphere Cursor AI ARR @ \$1MM to \$300MM in Twenty-Five Months

Anysphere Cursor AI – 3/23-4/25, per Anysphere

Something beautiful is happening to code...our aim with Cursor is to continue to lead this shift, by building a magical tool that will one day write all the world's software...

...Already, in Cursor, hours of hunting for the right primitives are being replaced by instant answers. Mechanical refactors are being reduced to single 'tabs.' Terse directives are getting expanded into working source. And thousand-line changes are rippling to life in seconds.

- Anysphere Press Release (8/24)

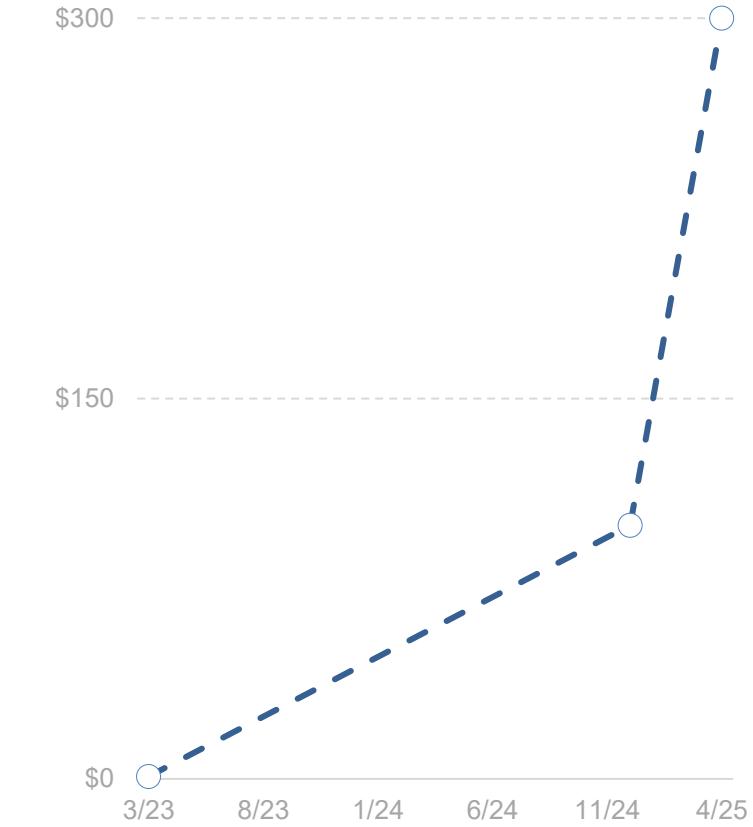

...We're delighted to report that Cursor is now used by millions of programmers as their editor of choice. Our proprietary models now generate more code than almost any LLMs in the world and edit over a billion characters per day.

Our business is large and fast growing, having exceeded \$100MM in recurring revenue.

- Anysphere Team (8/24 & 1/25)

Note: Cursor launched in 4/23. We show 3/23 as the first datapoint with an assumed \$0 in ARR. Source: Cursor / Anysphere (8/24, 11/24 & 1/25), Anysphere Co-Founder & CEO Michael Truell via Lenny's Newsletter, 'The rise of Cursor: The \$300M ARR AI tool that engineers can't stop using' (5/1/25)

AI Model Releases

On the back of Google's 'Attention is All You Need' Transformers research paper in 2017, the first wave of 'modern AI' (read: LLMs) focused on text: models such as OpenAI's GPT-3 and Meta's Llama-1 showed that teaching computers to finish sentences at scale could unlock broad reasoning abilities.

Yet human communication is rarely text-only, and often not even text-first.

Images, audio, video, and sensor readings carry context that words alone miss, so researchers at the same companies –

and peers like Google, Anthropic, and xAI, among others – began extending language models to handle additional signals.

Multimodal AI models are the result. They embed text, pictures, sound, and video into a shared representation and generate outputs in any of those formats.

A single query can reference a paragraph and a diagram, and the model can respond with a spoken summary or an annotated image – without switching systems.

Each new modality forces models to align meaning across formats rather than optimize for one.

The path to this capability unfolded stepwise: OpenAI's CLIP paired vision and language in 2021; Meta followed with ImageBind in 2023 and Chameleon in 2024;

and by 2024-2025, frontier systems such as GPT-4o, Claude 3, and Chameleon had become fully multimodal.

Each new modality forced the models to align meaning across formats rather than optimize for one.

The payoff is practical.

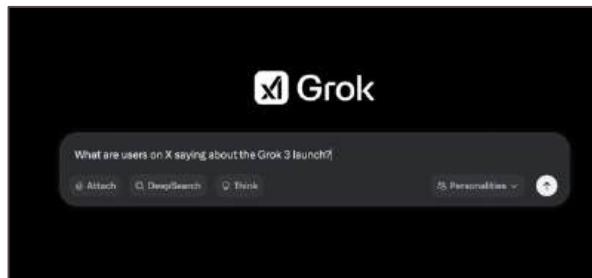

A field engineer can aim a phone camera at machinery and receive a plain-language fault diagnosis; a clinician can attach an X-ray to a note and get a structured report draft; and an analyst can combine charts, transcripts, and audio clips in a single query.

Compared with text-only models, multimodal systems cut context switching, capture richer detail, and enable applications –

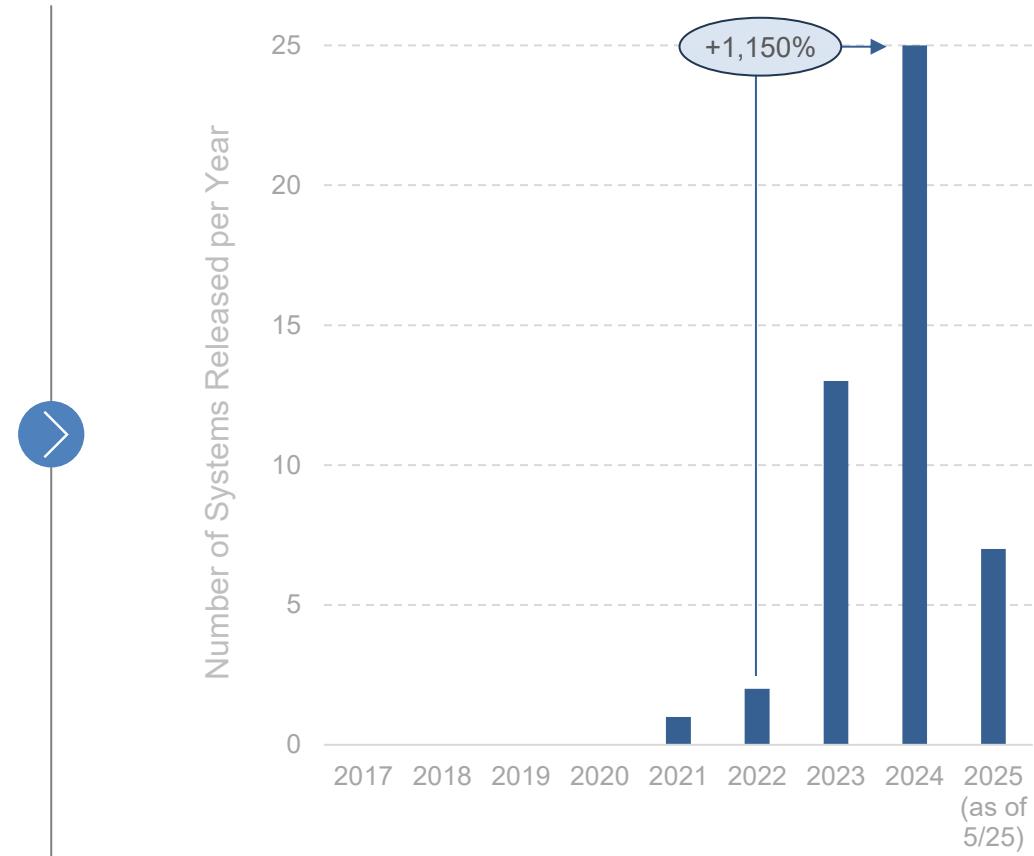

quality control, assistive tech, content creation – where visual or auditory information matters as much as words.

Rising Competition

+

Open-Source Model Momentum

(& China's Rise)

To understand where AI model development is headed, it helps to examine how two distinct approaches – closed-source and open-source – have evolved and diverged.

In the early days of modern machine learning (2012-2018), most models were open-source, rooted in academic and collaborative traditions.

But as AI systems became more powerful and commercially valuable, and as development shifted from academia to industry, a parallel movement emerged – around 2019 (when GPT-2 launched with restricted weights), the development of proprietary (closed-source) models, motivated by proprietary interests, competitive advantage, and safety concerns.

Closed models follow a centralized, capital-intensive arc. These models – like OpenAI's GPT-4 or Anthropic's Claude – are trained within proprietary systems on massive proprietary datasets, requiring months of compute time and millions in spending.

They often deliver more capable performance and easier usability, and thus are preferred by enterprises and consumers, and – increasingly – governments. However, the tradeoff is opacity: no access to weights, training data, or fine-tuning methods.

What began as a research frontier became a gated product experience, served via APIs, licensed to enterprises, and defended by legal and commercial firewalls. Now, the AI race is coming full circle.

As LLMs mature – and competition intensifies – we are seeing resurgence of open-source models owing to their lower costs, growing capabilities, and broader accessibility for developers and enterprises alike.

These are freely available for anyone to use, modify, and build upon, and thus are generally preferred by early-stage startups, researchers / academics, and independent developers.

Platforms like Hugging Face have made it frictionless to download models like Meta's Llama or Mistral's Mixtral, giving startups, academics, and governments access to frontier-level AI without billion-dollar budgets.

Open-source AI has become the garage lab of the modern tech era: fast, messy, global, and fiercely collaborative.

And China (as of Q2:25) – based on the number of large-scale AI models* released – is leading the open-source race, with three large-scale models released in 2025 – DeepSeek-R1, Alibaba Qwen-32B and Baidu Ernie 4.5**.

The split has consequences. Open-source is fueling sovereign AI initiatives, local language models, and community-led innovation.

Closed models, meanwhile, are dominating consumer market share and large enterprise adoption.

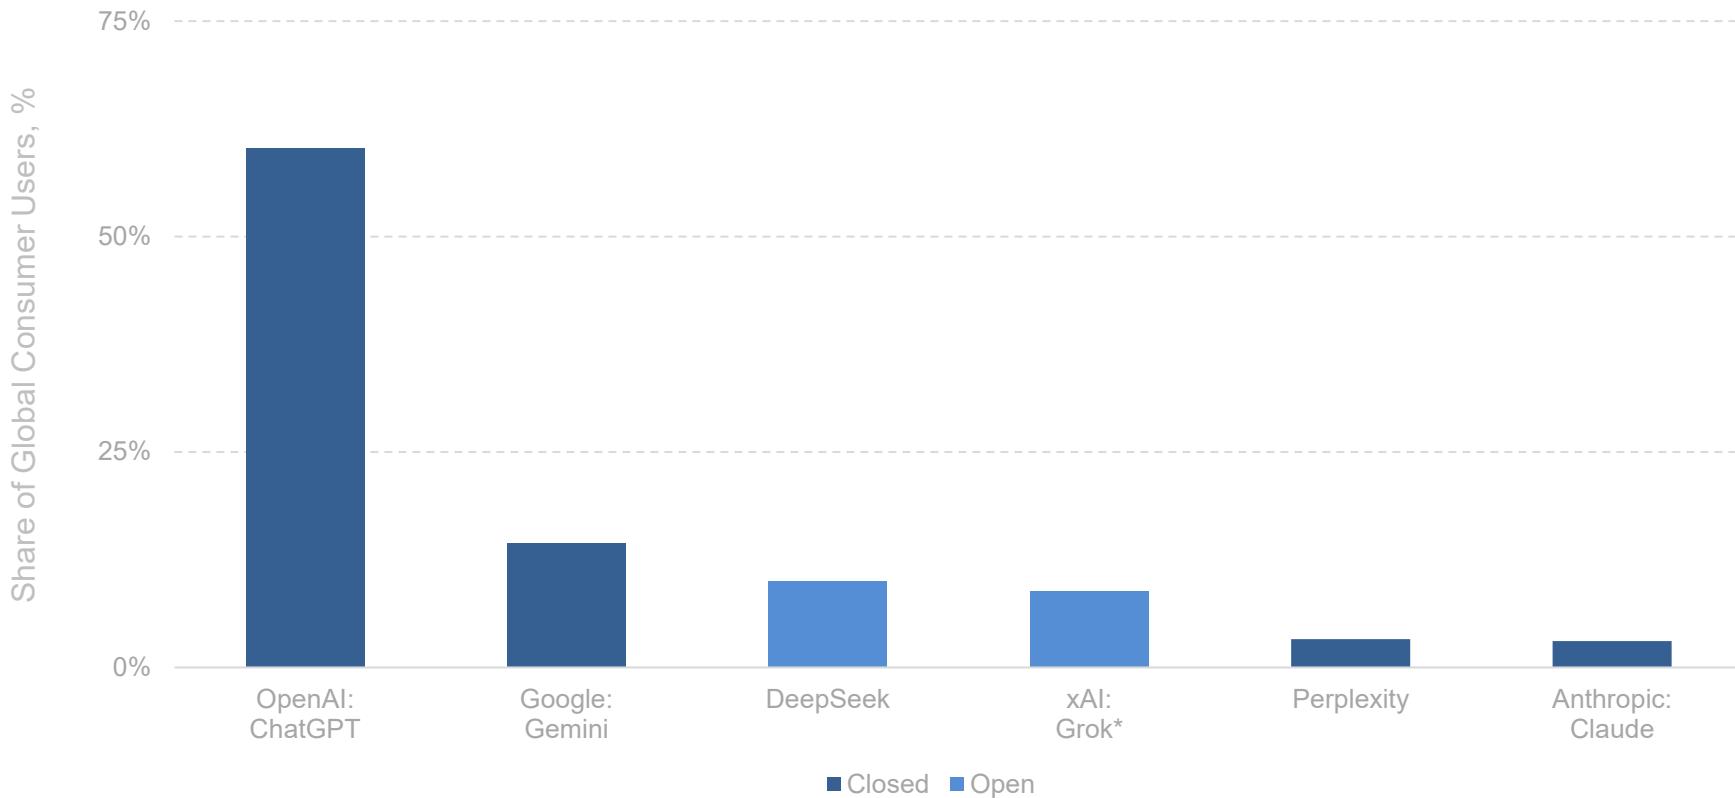

We're watching two philosophies unfold in parallel – freedom vs. control, speed vs. safety, openness vs. optimization – each shaping not just how AI works, but who gets to wield it.

*Large-scale AI models = Models with training compute confirmed to exceed 10^{23} floating point operations.

**To be made open-source as of 6/30/25, per Baidu.

Closed vs. Open-Source Models – Monthly Active Users (MAUs) = Closed Models Dominating With Consumers, per YipitData

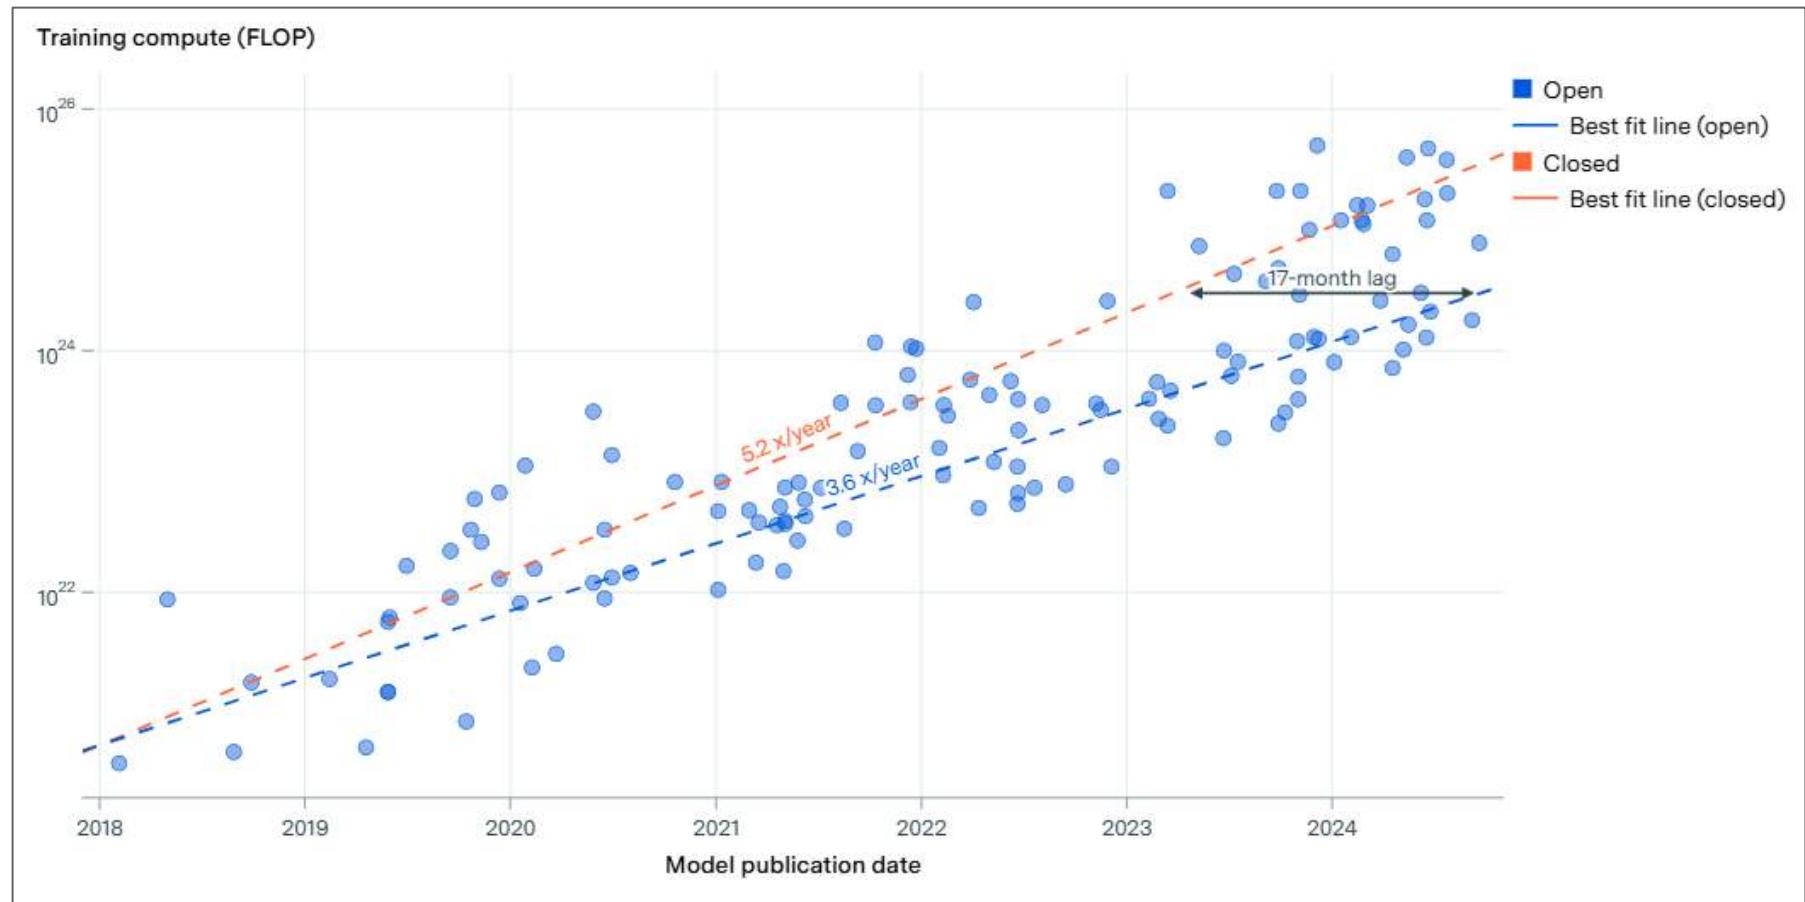

Estimated Share of Global Monthly Active Users (MAUs) Across Six Leading LLMs – 4/25, per YipitData

*xAI open-sourced the Grok-1 base model in March 2024, but newer versions and full chatbot features remain proprietary. Note: Data is a subset of global internet users and absolute user data will be understated; however, given that the panel is globally-representative (with limitations on China-specific data), relative comparisons / trends are informative. Desktop users only. Figures calculate the number of users on a given platform, divided by the number of users on all platforms combined. Figures are non-deduped (i.e., users using multiple platforms may be counted twice). Data measures several million global active desktop users' clickstream data. Data consists of users' web requests & is collected from web services / applications, such as VPNs and browser extensions. Panel is globally-representative (with limitations on China-specific data). Users must have been part of the panel for 2 consecutive months to be included. Source: YipitData (5/25)

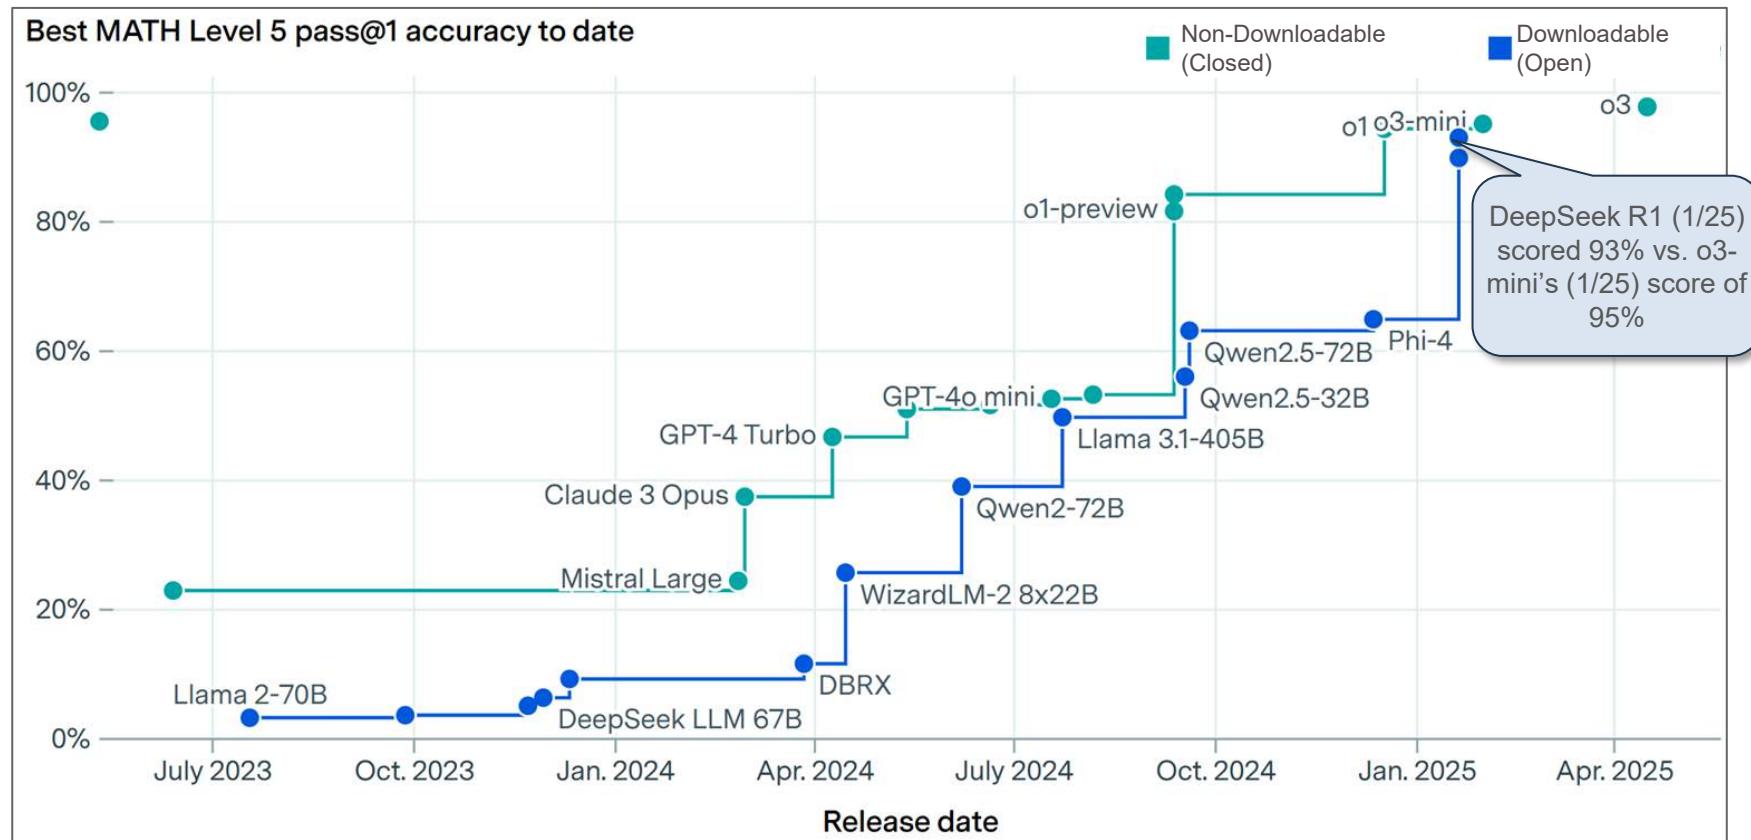

Closed vs. Open-Source Models – Compute Investment = Closed Models Higher, per Epoch AI

Training Compute Resources for Open vs. Closed LLMs – 2/18-9/24, per Epoch AI

Closed vs. Open-Source Models – Performance = Gap Closing...China Rising, per Epoch AI...

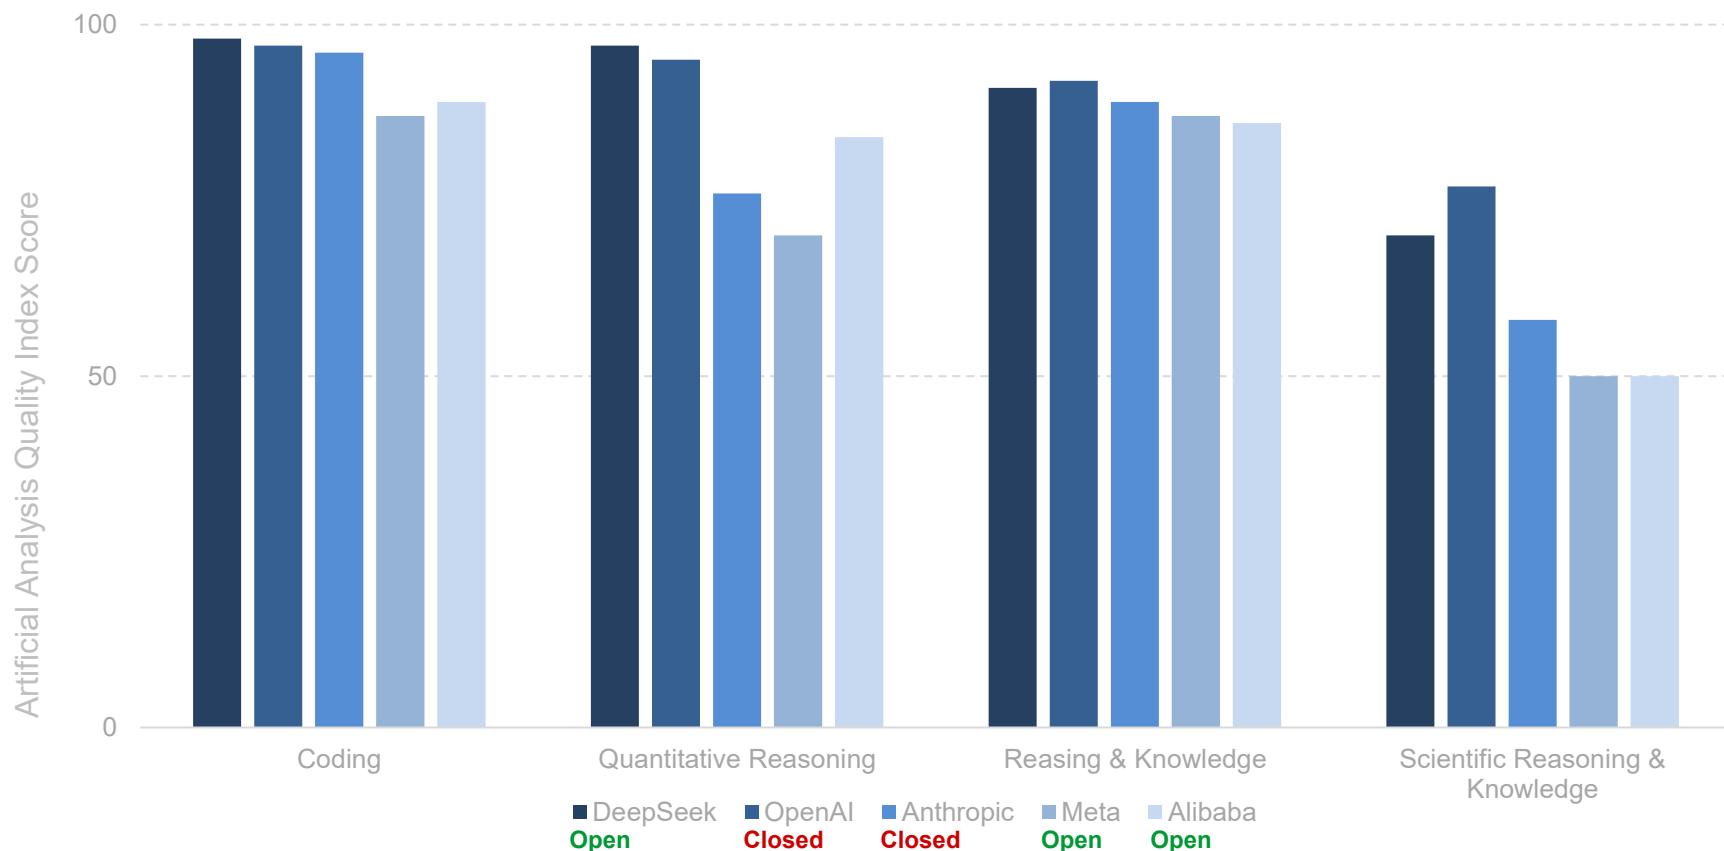

Performance on MATH Level 5 Test, Open vs. Closed LLMs by Year Released – 6/23-4/25, per Epoch AI

Note: MATH Level 5 pass@1 refers to the accuracy of an AI model on the MATH benchmark, a dataset of high school competition-level mathematics problems. Level 5 indicates the most challenging problems in the benchmark. 'pass@1' measures whether the model correctly solves the problem on its first attempt. Source: Epoch AI (5/25)

...Closed vs. Open-Source Models – Performance = Gap Closing...China Rising, per Artificial Analysis

AI Model Performance by Provider – 1/25, per Artificial Analysis

Note: Scores are out of 100. The models for each company that are measured: for OpenAI, o1; for Alibaba, Qwen 2.5 72B; for Meta, Llama 3.1 405B; for Anthropic, Claude 3.5 Sonnet. The tests used are HumanEval, MATH-500, MMLU and GPQA Diamond. Source: Artificial Analysis via NBC News, 'Why DeepSeek is different, in three charts' (1/25)

Rising Performance of Open-Source Models

+

Falling Token Costs

=

Explosion of Usage by Developers Using AI

Closed-source models – like GPT-4, Claude, or Gemini – have dominated usage among consumers and large enterprises, largely because of their early performance advantage, ease of use, and broader awareness. These models came bundled in clean, productized interfaces and offered reliable outputs with minimal setup.

For enterprises, they promise security and ease-of-use for non-technical employees. For consumers, they came with name recognition, fast onboarding, and polished UX. That combination has kept closed models at the center of the AI mainstream.

But performance leadership is no longer a given. Open-source models are closing the gap – faster than many expected – and doing so at a fraction of the cost to users. Models like Llama 3 and DeepSeek have demonstrated competitive reasoning, coding, and multilingual abilities, while being fully downloadable, fine-tunable, and deployable on commodity infrastructure.

For developers, that matters. Unlike enterprise buyers or end-users, developers care less about polish and more about raw capability, customization, and cost efficiency.

And it is developers – more than any other group – who have historically been the leading edge of AI usage.

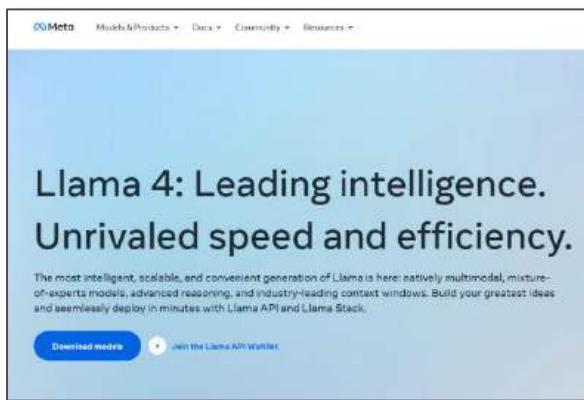

The recent trend appears increasingly clear: more developers are gravitating toward low-cost, high-performance open models, using them to build apps, agents, and pipelines that once required closed APIs.

Time will tell if that advantage scales beyond the developer ecosystem. Many open-source tools still lack the brand power, plug-and-play user experience (UX), and managed services that drive adoption among consumers and large organizations.

But as the cost-performance ratio of open models continues to improve – and if the infrastructure to support them becomes more turnkey – those advantages could start to spread beyond the developer community.

Developer AI Model Activity = +3.4x Increase in Downloads of Meta Llama in Eight Months

Meta Llama – 8/24-4/25, per Meta Platforms

I predicted that 2025 was going to be the year that open source became the largest type of model that people are developing with, and I think that's probably going to be the case. That's kind of how we're thinking about this overall.

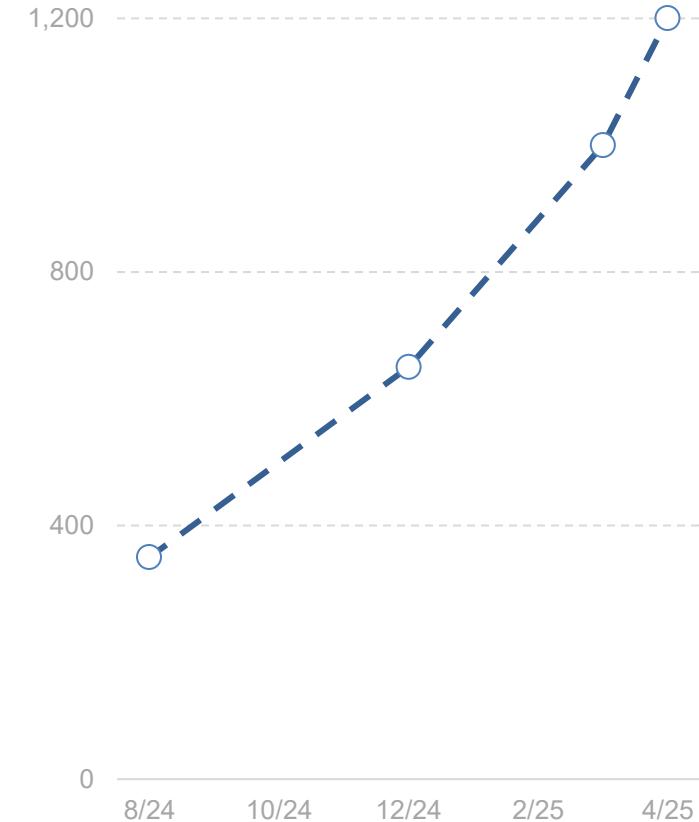

- Meta Platforms CEO Mark Zuckerberg, 5/25

The groundswell of support for Llama has been awesome. We announced ten weeks ago a billion downloads after the release of Llama 4. In just ten weeks, that number is now 1.2. And if you look at Hugging Face (where the downloads are happening), what's cool is that most of these are derivatives. We have thousands of developers contributing.

- Meta Platforms Chief Product Officer Chris Cox, 5/25

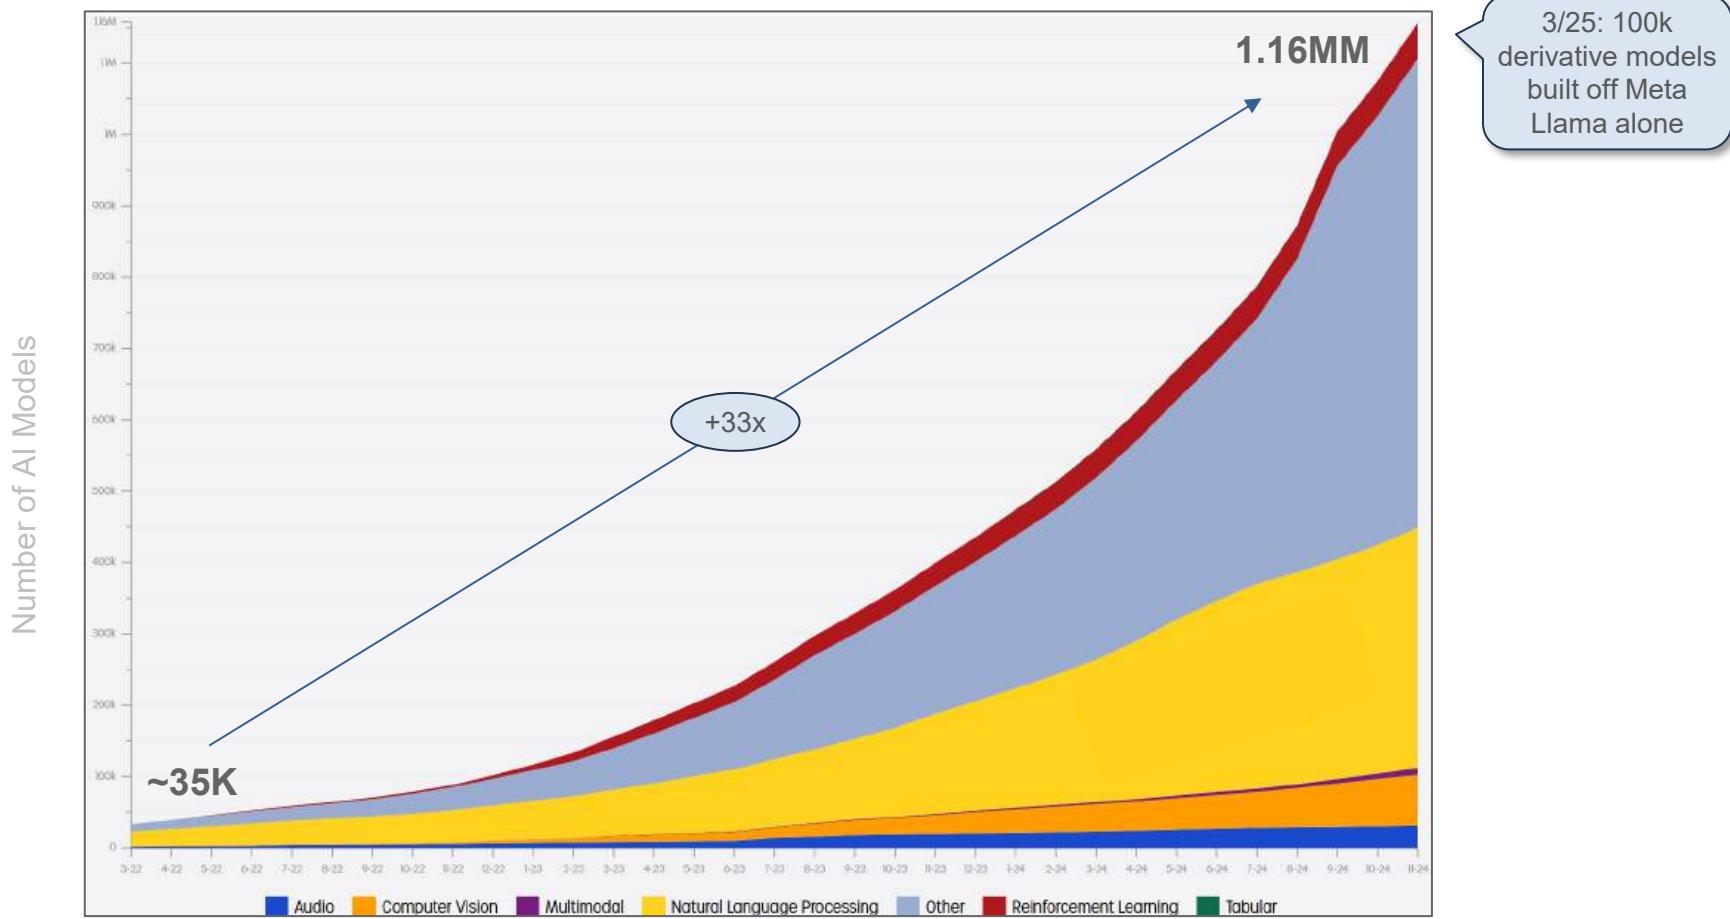

Note: 12/24 disclosure counted downloads of Llama and its derivatives. Source: Meta Platforms (8/24, 12/24, 3/25, 4/25), Stratchery podcast (5/25)

Meta Llama Downloads (MM) – 8/24-4/25

Developer AI Model Activity = +33x Increase in AI Models on Hugging Face – 11/24 vs. 3/22

AI Models Available from Hugging Face – 3/22-11/24, per Hugging Face

Note: Hugging Face is an online platform that hosts and shares machine learning models, datasets, and tools – commonly used to access, test, and deploy AI models, including large language models. It has become a central hub for the open-source AI community. May include open-source and closed models. Source: Hugging Face (5/25), Meta (3/25)

AI Monetization Threats

Rising Competition

+

Open-Source Model Momentum

(& China's Rise)

As noted on page 8, Meta CTO Andrew Bosworth referred to the current state of AI as *our space race and the people we're discussing, especially China, are highly capable...*

In this context, it is important to remember what the stakes of the Space Race were: proving which political system could innovate faster and win the world's trust in the process. Coming out on top in the Space Race played a role in enhancing USA's strategic deterrence and cementing the primacy of western democratic values. The AI 'space race,' also has the potential to reshape the world order.

China certainly knows these stakes. Back in 2015, 'Made in China 2025,' a new Chinese government initiative to shift the country from low-cost to high-value manufacturing in critical industries, seemed decades away.

Fast forward to today, and China has dramatically accelerated its capabilities in these strategic sectors like robotics, electrification, and 'information technology' – best expressed by world-class artificial intelligence.

Chinese AI capabilities now underpin nationally strategic areas such as battlefield logistics, target recognition, cyber operations, and autonomous decision-making platforms. In 2025, Chinese state media highlighted the integration of AI into non-combat support functions (e.g., military hospitals), while the Ministry of Science and Technology reinforced its commitment to 'indigenous innovation' in strategic technologies.

The implications of Chinese AI supremacy would be profound.

As OpenAI's Sam Altman noted in a July 2024 *Washington Post* Op-Ed, *If [authoritarian regimes] manage to take the lead on AI, they will force U.S. companies and those of other nations to share user data, leveraging the technology to develop new ways of spying on their own citizens or creating next-generation cyberweapons to use against other countries.*

...Meanwhile, alongside AI, broader economic trade tensions between the USA and China continue to escalate, driven by competition for control over strategic technology inputs. China, for now, remains the dominant global supplier of 'rare earth elements' – materials essential to advanced electronics, defense systems, and clean energy infrastructure – an imbalance that the USA is working hard to counter. Simultaneously, the USA has prioritized the reshoring of semiconductor manufacturing, supported by the CHIPS and Science Act, and bolstered its partnerships with allied nations (including Japan, South Korea and the Netherlands) to reduce reliance on Chinese supply chains.

Taiwan continues to play a pivotal role in this dynamic. Despite American invention of core semiconductor technology like transistors and EUV lithography, it is Taiwan's TSMC – the world's most advanced semiconductor foundry – that drives global semiconductor production and is therefore central to both countries' strategic calculations.

It has taken a long time for the USA to wake up, but after two decades of inaction, both political parties are calling loudly for change. While each has taken a different approach (export controls in the Biden administration, economic nationalism and reshoring in the Trump administration), the move towards treating cutting-edge technology development as a core part of the national interest is a welcome adjustment.

As Senators John Cornyn and Mark Warner noted in 2020 regarding semiconductors, *America's innovation in semiconductors undergirds our entire innovation economy...unfortunately, our complacency has allowed our competitors – including adversaries – to catch up.*

However, despite these measures, American intellectual property remains at risk; per OpenAI, *We know PRC (China) based companies – and others – are constantly trying to distill the models of leading US AI companies...it is critically important that we are working closely with the US government to best protect the most capable models from efforts by adversaries and competitors to take US technology.*

What is clear, however, is that the American tone about Chinese technology has morphed since the early 2000s enthusiasm around China's entry into the World Trade Organization (WTO). AI, semiconductors, and critical minerals, and technology developments in general, are no longer viewed solely as economic or technology assets – they represent strategic levers of national resilience and geopolitical power, core to both the USA and China.

DeepSeek narrows China-US AI gap to three months, 01.AI founder Lee Kai-fu says

By Liam Mo and Kane Wu

March 25, 2025 12:08 AM PDT - Updated 20 hours ago

□ Aa 

The Deepseek logo is seen in this illustration taken Jan. 27, 2025. REUTERS/Dado Ruvic/Illustration/File Photo Purchase Licensing Rights 

BEIJING/HONG KONG, March 25 (Reuters) - China has narrowed the AI development gap with the United States to just three months in some areas, because firms such as DeepSeek have worked out how to use chips and apply algorithms more efficiently, the CEO of Chinese startup 01.AI Lee Kai-fu said.

Lee, a prominent figure in the global artificial intelligence space and a former head of Google China, told Reuters that startup DeepSeek revealed that China had pulled ahead in areas such as infrastructure software engineering

We believe that as the economy develops, China should gradually become a contributor instead of freeriding. In the past 30+ years of the IT wave, we basically didn't participate in real technological innovation. We're used to Moore's Law falling out of the sky, lying at home waiting 18 months for better hardware and software to emerge. That's how the Scaling Law is being treated...

What we see is that Chinese AI can't be in the position of following forever. We often say that there is a gap of one or two years between Chinese AI and the United States, but the real gap is the difference between originality and imitation. If this doesn't change, China will always be only a follower – so some exploration is inescapable.

- DeepSeek CEO Liang Wenfang, 11/24

Alibaba, the Chinese tech giant, released a new version of its AI model and made big claims – notably that it outperforms OpenAI's ChatGPT and the [newly ascending DeepSeek](#).

Qwen2.5-Max outperforms DeepSeek V3 in benchmarks such as Arena-Hard, LiveBench, LiveCodeBench, and GPQA-Diamond, while also demonstrating competitive results in other assessments, including MMLU-Pro.

Our base models have demonstrated significant advantages across most benchmarks, and we are optimistic that advancements in post-training techniques will elevate the next version of Qwen2.5-Max to new heights.

The scaling of data and model size not only showcases advancements in model intelligence but also reflects our unwavering commitment to pioneering research. We are dedicated to enhancing the thinking and reasoning capabilities of large language models through the innovative application of scaled reinforcement learning.

BEIJING, April 25 (Reuters) - Chinese search engine giant Baidu (9888.HK) [launched](#) its latest artificial intelligence model, Ernie 4.5 Turbo, on Friday, as it ramps up AI product offerings amid mounting competition in the Chinese AI market.

It also launched its new reasoning model Ernie X1 Turbo.

ERNIE 4.5 Turbo is the newest member of the flagship ERNIE foundation model family. Imagine an AI that's not just smart, but also affordable and versatile. Here's why it's turning heads:

- Multimodal Prowess: It excels in handling text, images, and even videos, making it a Swiss Army knife for developers.

- Cost-Effectiveness: Priced at just RMB 0.8 per million tokens for input and RMB 3.2 for output, it's 80% cheaper than its predecessor – and a fraction of the cost of leading competitors. It costs only 40% of DeepSeek V3 and just 0.2% of GPT-4.5.

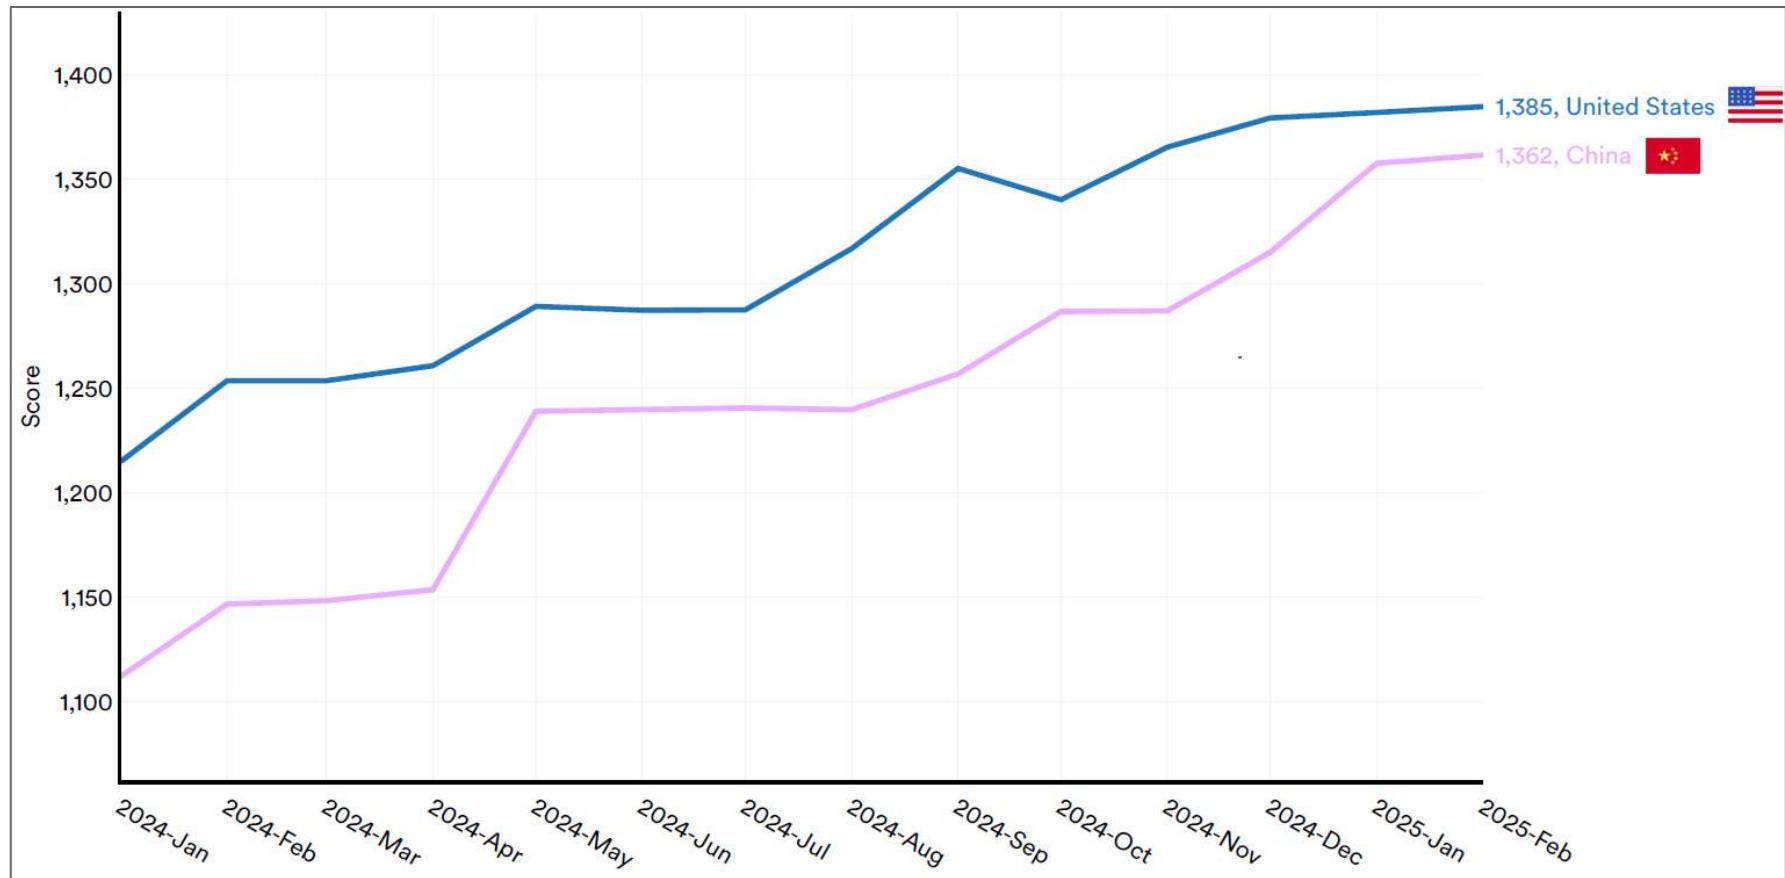

- High Performance: Benchmark tests show it matches GPT-4.1 and outperforms GPT-4o in most multimodal tasks – delivering high-impact results with every run.

- Baidu Post on X, 4/24/25

China Consumer AI Usage =
DeepSeek Rose Quickly

To understand how the generative AI market is evolving, it helps to examine the divergence in provider usage across regions, channels, and user preferences. At a global level, OpenAI's ChatGPT remains the clear leader in both desktop and mobile user share. But underneath the surface, the market is shifting.

Platforms like Anthropic's Claude are gaining momentum, and Google's Gemini continues to grow.

xAI's Grok posted a staggering +294% increase in global website visits month-over-month according to Similarweb – making it the fastest-growing AI assistant during the 2/25-3/25 window.

Geography is also playing an increasingly central role in shaping which models win. ChatGPT dominates in most countries – excluding Russia and China, where ChatGPT cannot operate and DeepSeek is strong.

China users are turning to local models at scale. According to Roland Berger Consulting, the top 10 AI apps by monthly active users in China are domestically developed...DeepSeek, Kimi, Nami AI, and ERNIE Bot are each racking up tens of millions of users. The story is different outside China, where ChatGPT leads by a wide margin.

The bifurcation is clear: domestic champions are emerging in China, while global platforms dominate elsewhere.

This reflects differences in regulation, language, cultural alignment, and platform reach.

It's foundational to remember how China has restricted platform access in its country.

Facebook, Twitter, Google and YouTube have been unavailable to Chinese citizens since 2010 or earlier.

Other restricted platforms include the likes of Instagram, WhatsApp, Wikipedia, Telegram and Spotify, and more recently, the likes of ChatGPT, Google Gemini, Anthropic Claude, Meta AI and Microsoft Copilot.

Sentiment is varied too. According to Stanford HAI and Ipsos, China citizens are materially more optimistic about AI's net benefits than their USA counterparts. 83% of Chinese respondents in 2024 said AI products and services have more benefits than drawbacks – up from 78% in 2022.

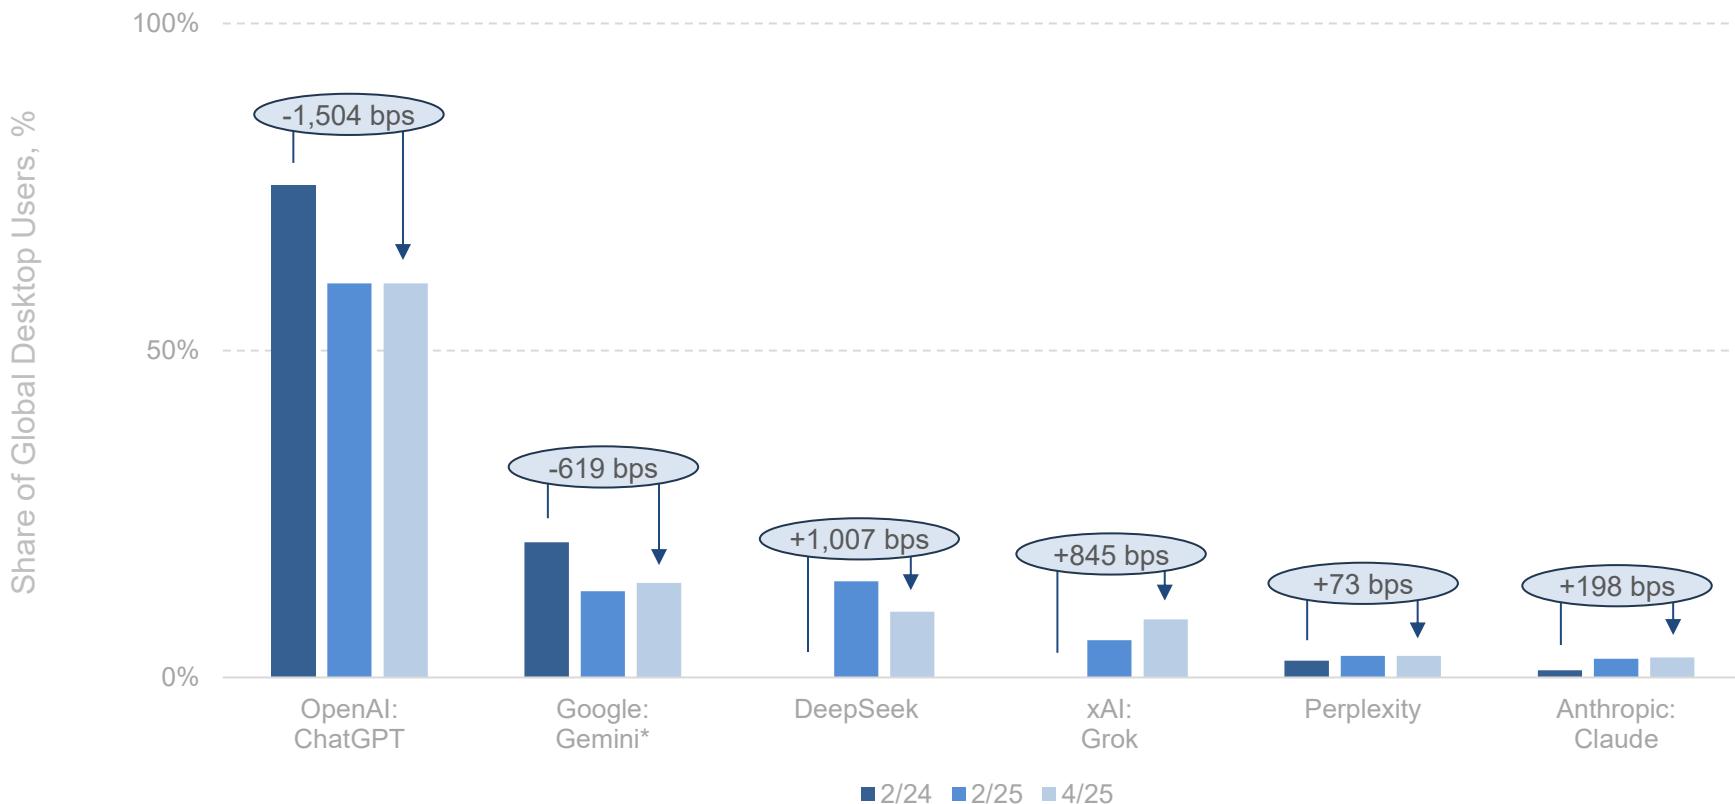

In contrast, only 39% of USA respondents shared that view, with little change over the two-year period.

It also reflects a deeper philosophical divide in how societies are adapting to AI: not just who builds it, but how it's perceived and embraced. In this environment, platform choice isn't just about price or performance.

It may be increasingly shaped by national identity.

LLM User Share – Desktop Users = OpenAI ChatGPT Leads...DeepSeek Rose Quickly, per YipitData...

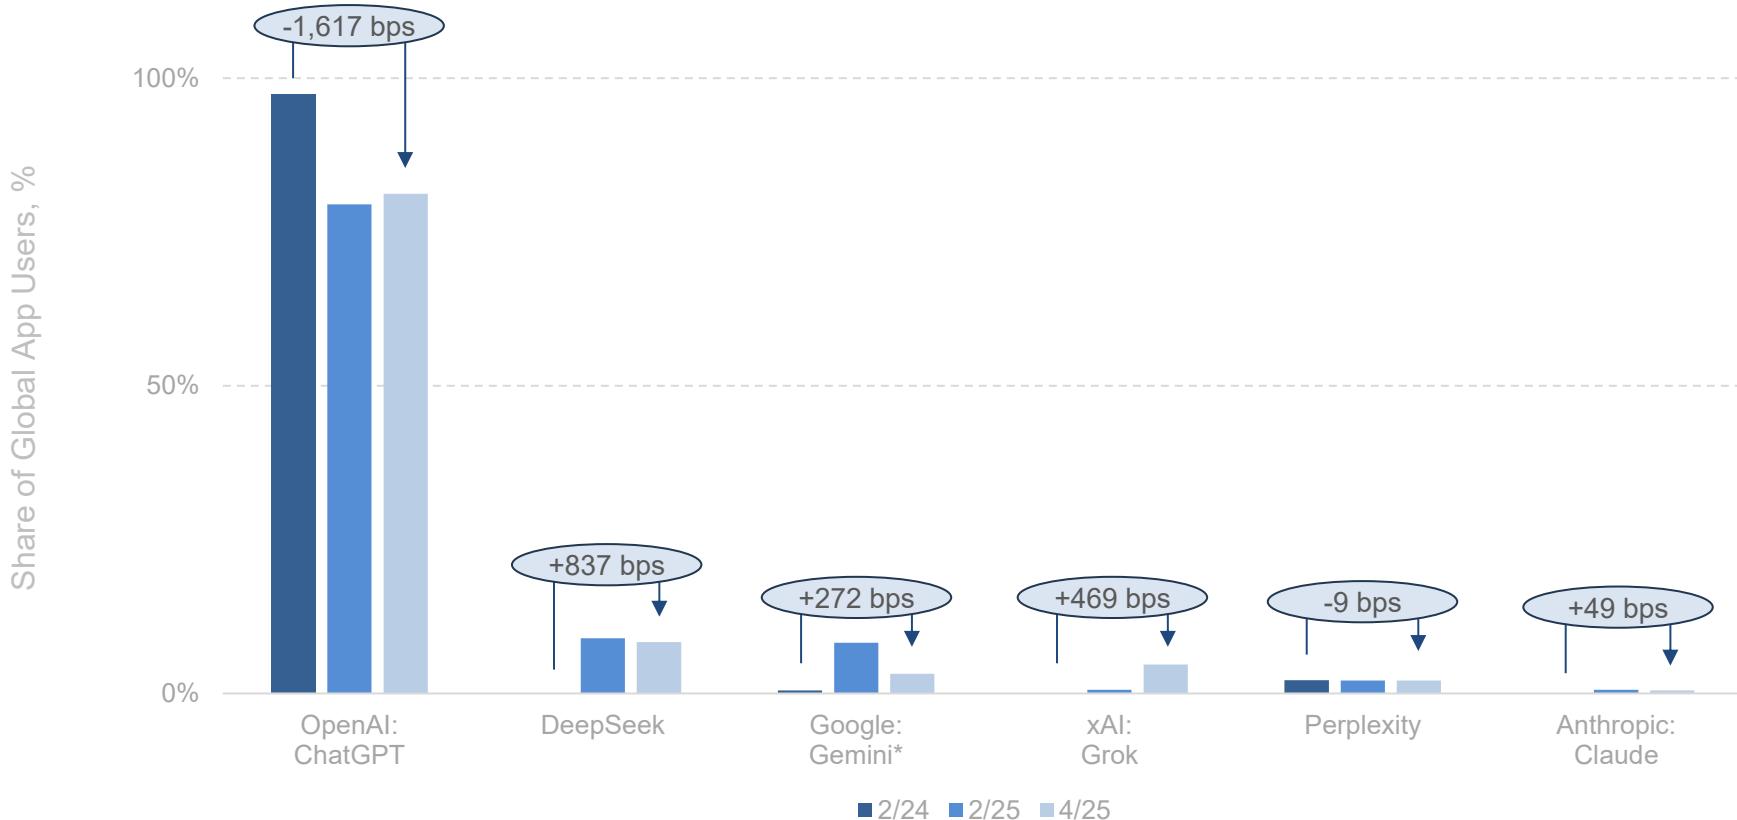

Estimated Global Monthly Active Desktop User Share – 2/24-4/25, per YipitData

*Chatbot only. Does not include other places Gemini is integrated. Note: User share shown across these five providers; other LLMs' user share not shown. Desktop users only. Figures calculate the number of users on a given platform, divided by the number of users on all platforms combined. Figures are non-deduped (i.e., users using multiple platforms may be counted twice). Data is a subset of global internet users and absolute user data will be understated; however, given that the panel is globally-representative (with limitations on China-specific data), relative comparisons / trends are informative. Data measures several million global active desktop users' clickstream data. Data consists of users' web requests & is collected from web services / applications, such as VPNs and browser extensions. Panel is globally-representative (with limitations on China-specific data). Users must have been part of the panel for 2 consecutive months to be included. Data is non-deduped; i.e., some users may use multiple platforms. Source: YipitData (accessed 5/25)

Fast + Data-Driven
- 7 Global Internet User Ramps Powered by AI from Get-Go =
Growth We Have Not Seen Likes of Before
- 8 AI & Work Evolution =
Real + Rapid

For the most part, we have focused on AI momentum and monetization of desktop / mobile software... AI momentum and monetization in our physical world is, in some respects, even more head-turning.

We are entering an era where intelligence is not just embedded in digital applications, but also in vehicles, machines, and defense systems.

Beyond the rise of digital agents, the world is increasingly experiencing the rise of physical agents.

Self-driving fleets like Waymo's and Tesla's Full Self-Driving (FSD) beta are no longer science projects confined to test tracks – they're revenue-generating deployments, logging millions of driverless miles with increasingly autonomous software loops. The stack beneath them is getting smarter, and the data is more vast and richer. Applied Intuition, for example, is building simulation platforms and software-defined vehicle systems that abstract autonomy away from hardware – so manufacturers can ship intelligence as easily as parts. Per Uber CEO Dara Khosrowshahi, *Fast forward 15, 20 years, I think that the autonomous driver is going to be a better driver than the human driver. They will have trained on lifetimes of driving that no person can, they're not going to be distracted.*

We are seeing the early architecture of AI-native infrastructure for the physical world.

In defense, companies like Anduril are redefining what defense looks like – shipping autonomous drones and counter-intrusion systems with AI in every edge node, not just the command center. In agriculture, companies like Carbon Robotics are putting AI into the dirt – using computer vision to eliminate weeds without herbicides.

We believe that these are examples of a broader shift: a world where AI turns capital assets into software endpoints. Intelligence, once confined to screens and dashboards, becomes kinetic.

Physical World AI – Vertically-Integrated Electric Vehicles (Tesla) = ~100x Increase in Fully Self-Driven Miles Over Thirty-Three Months

Tesla Vertically-Integrated Electric Vehicles

For full self-driving, we've released version 12, which is a complete architectural rewrite compared to prior versions.

This is end-to-end artificial intelligence...

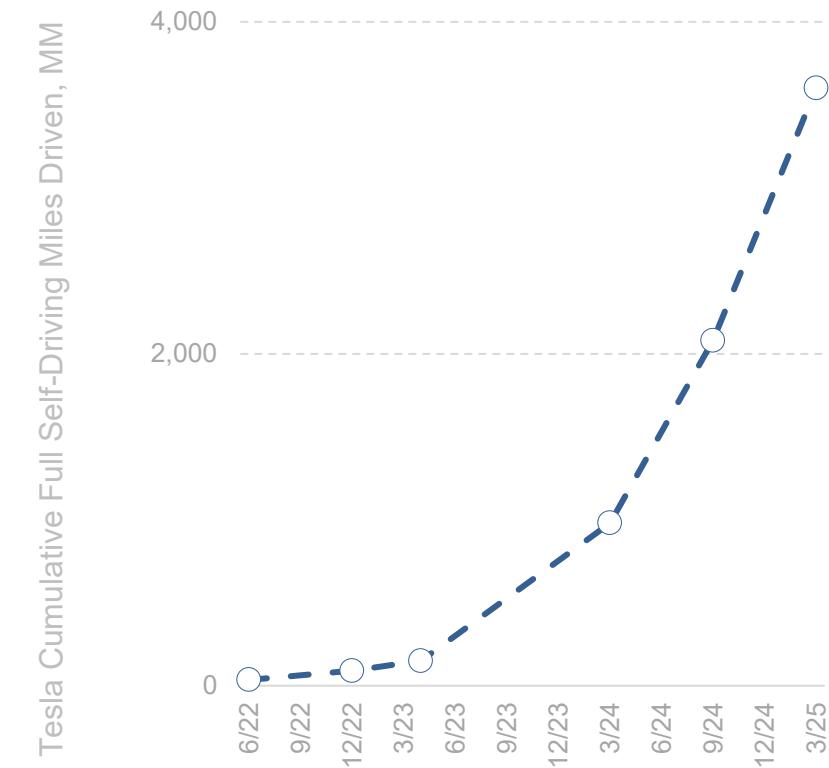

...And it really is...quite a profound difference...

...So, this is the first time AI is being used, not just for object perception, but for path planning and vehicle controls. We replaced 330,000 lines of C++ code with neural nets. It's really quite remarkable. So, as a side note, I think Tesla is probably the most probably the most efficient company in the world for AI inference. Out of necessity.

- Tesla CEO Elon Musk, 1/24

Source: Tesla Disclosures & Q1:25 Investor Deck

Tesla Cumulative Fully Self-Driven Miles (MM) – 6/22-3/25, per Tesla

Physical World AI – Fully-Autonomous Vehicles (Waymo) = 0% to 27% Share of San Francisco Rideshares Over Twenty Months, per YipitData

Waymo Fully-Autonomous Vehicles

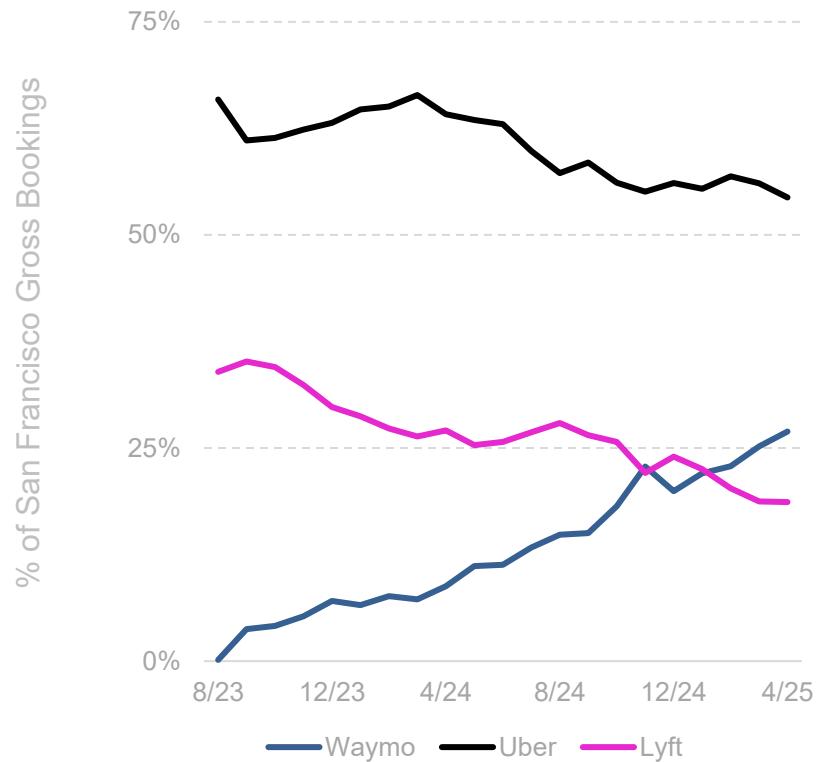

[We are creating] an end-to-end, very, very robust, and large end-to-end system that's multi-modal in its foundation so that perception planning and prediction... can become even more robust than it is today.

- Waymo Co-CEO Tekedra Mawakana, 1/25

What we've done in San Francisco is prove to ourselves – and to the world – that not only does autonomy work, but it works at scale in a market and can be a viable commercial product.

- Waymo Co-CEO Dmitri Dolgov, 3/25

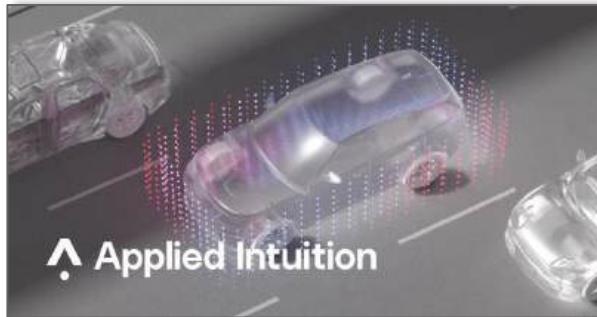

Estimated Market Share (Gross Bookings) – 8/23-4/25, San Francisco Operating Zone, per YipitData

Note: Data derived from USA-user email receipt panel composed of >1mm monthly transacting USA email accounts from all available domains. Paid rides only. Numbers are estimates due to sample size. Source: Waymo, Tech Brew (1/25), Fast Company (3/25), YipitData (4/4/25)

Physical World AI –Vehicle Intelligence (Applied Intuition) = Serving Automotive, Trucking, Construction & Defense

Applied Intuition Vehicle Intelligence

Within the last few years, we've seen massive advances in artificial intelligence that will have groundbreaking impacts on the industries that Applied Intuition serves. Our role as a leader in the ecosystem is to bring the best of what Silicon Valley has to offer to our global customer base.

- Applied Intuition Co-Founder & CEO Qasar Younis, 3/24

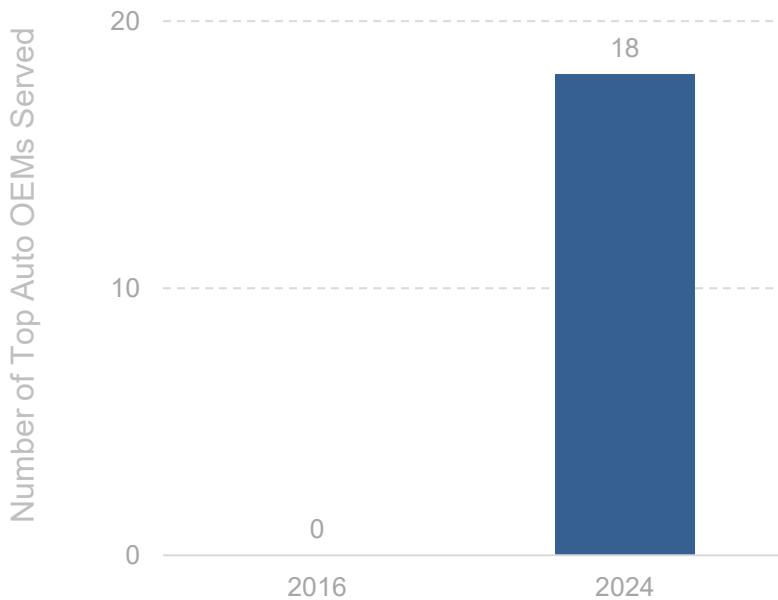

We've seen accelerating adoption of our AI-powered tools, autonomy software, and vehicle operating system as traditional OEMs are seeing strong ROI. The Defense sector is also looking for vehicle intelligence solutions. We've provided our off-road autonomy stack for defense for several years, and have expanded our defense tech product portfolio significantly over the past year.

- Applied Intuition Co-Founder & CTO Peter Ludwig, 5/25

Note: OEM = Original Equipment Manufacturer.

Source: Applied Intuition

Applied Intuition Top Global Auto OEMs Served – 2016-2024, per Applied Intuition*

** Applied Intuition serves a broad base of customers in different verticals, such as Porsche / Toyota (auto), Traton / Isuzu (trucking), Caterpillar (construction) and several US military branches (defense).*

Physical World AI – USA Defense (Anduril) = +2x Y/Y Revenue Growth for Last Two Years

Anduril AI-Enabled Autonomous USA Defense Systems

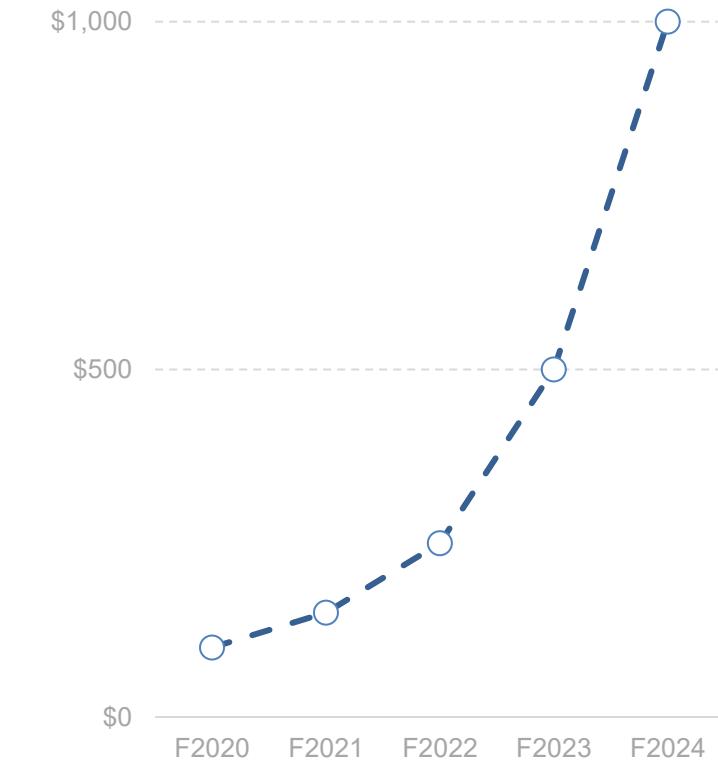

At Anduril, we firmly believe that today's most pressing national security challenges cannot be solved without AI-enabled systems and autonomy at scale. These systems will help to keep our service members safe and empower them to make better decisions at the speed of modern warfare...

...When developed and deployed properly, [AI and autonomous systems] can make warfare more proportional, more precise, and less indiscriminate than it has ever been before.

- Anduril Co-Founder & CEO Brian Schimpf, 12/23

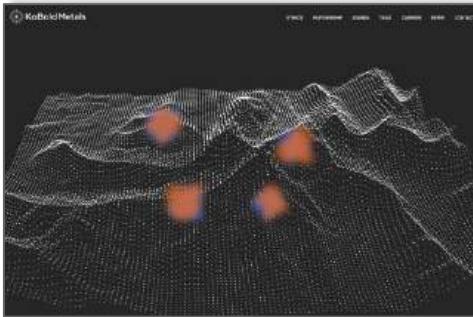

Anduril Estimated Revenue (\$MM) – F2020-F2024, per News Reports

Source: Anduril, Forbes, TechCrunch, CNBC

Physical World AI = AI-Driven Mining Exploration (KoBold Metals) = Reversing Trend in Exploration Inefficiency

KoBold Metals AI-Driven Mining Exploration

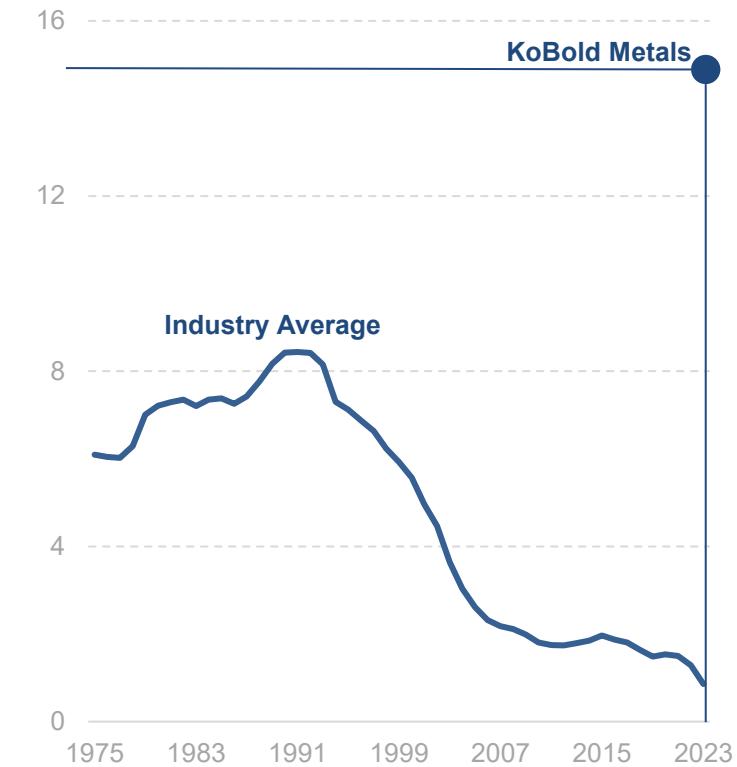

We're looking to expand and diversify the supply of these metals all over the world, but we're taking a totally different approach [from conventional mining companies]. Two-thirds of our team are software engineers or data scientists.

- KoBold Metals Co-Founder & CEO Kurt House, 12/22

KoBold's Machine Prospector technology combines never before used datasets with conventional geochemical, geophysical, & geological data in statistical association models to identify prospects. KoBold's technology accelerates exploration by efficiently screening large regions & makes our search more effective by identifying the most promising locations.

- KoBold Metals Website

Mineral Deposit Discoveries per \$B of Exploration Spend – 1975-2023, per KoBold Metals

Source: KoBold Metals, Wired (12/22)

Physical World AI – Agricultural Modernization (Carbon Robotics) = 230K+ Acres Weeded / 100K+ Gallons of Glyphosate Prevented

Carbon Robotics AI-Driven Agricultural Modernization

The LaserWeeder leverages our sophisticated laserweeding technology, driven by AI deep learning models and computer vision software, to efficiently identify, target, and eliminate weeds by zapping them at the meristem. The implement can cover up to 2 acres per hour and shoot up to 200,000 weeds.

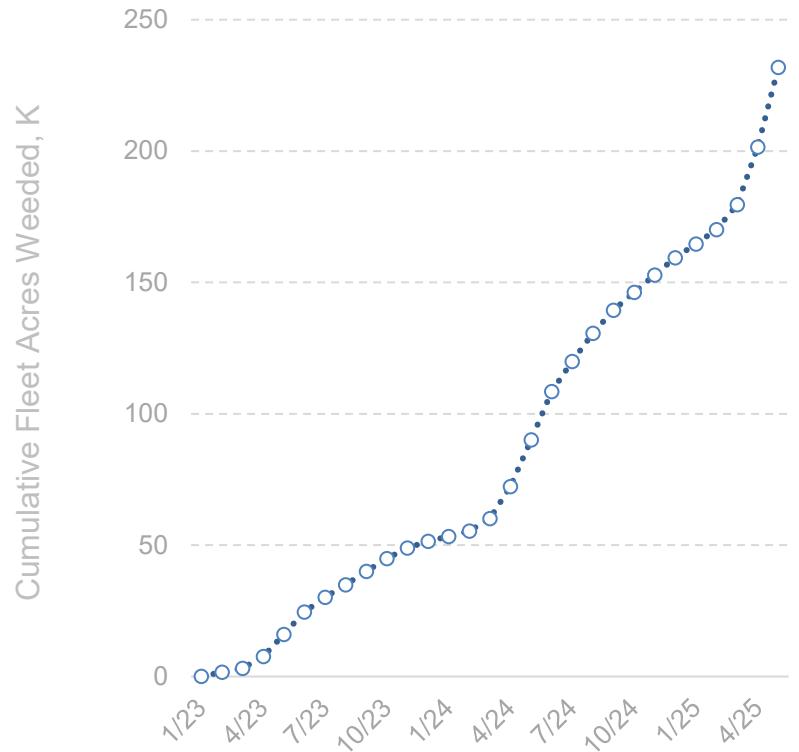

- Carbon Robotics Founder & CEO Paul Mikesell, 12/22

We learned from farmers that their biggest challenges continue to be around labor and labor availability. If they could, they would run everything 24/7. They would run everything every minute of farming season to get as much done as possible.

- Carbon Robotics Founder & CEO Paul Mikesell, 3/25

Source: Carbon Robotics, Organic Produce Network (12/22), GeekWire (3/25)

Carbon Robotics Cumulative Fleet Acres Weeded (K) – 1/23-5/25, per Carbon Robotics

Physical World AI – Intelligent Grazing (Halter) = +150% Net-New Livestock Collars Contracted Y/Y

Halter AI-Driven Intelligent Grazing

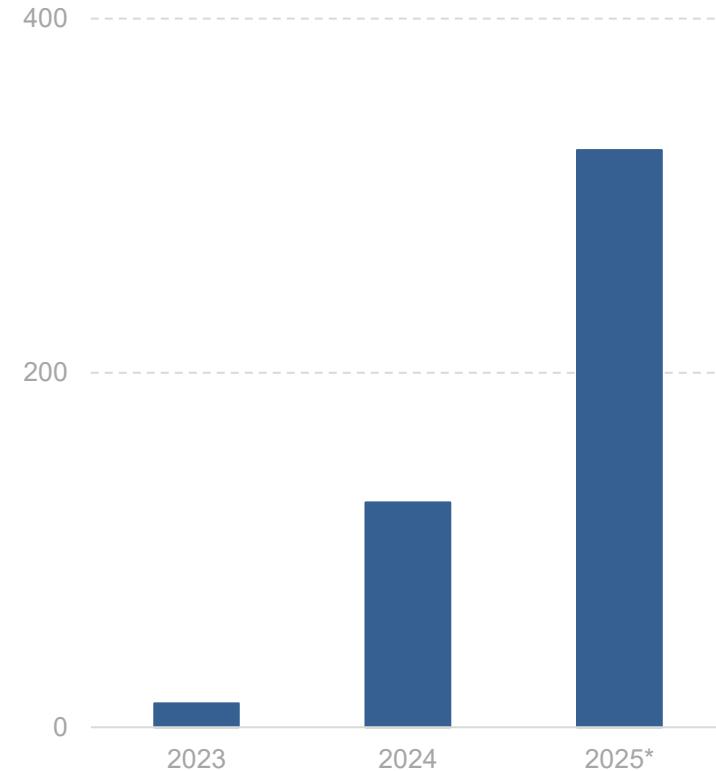

We've seen firsthand the care and dedication ranchers have for their land and animals. We've also seen how agriculture, one of the oldest and most vital industries, has yet to receive the full benefits of modern technology. This leaves enormous opportunity for ranchers to unlock greater productivity and sustainability across their operations.

We believe grazing management holds the key. Effective rotational grazing enables more efficient use of natural resources and increased productivity, while also enhancing soil health and improving root structures to sequester more carbon. We don't believe more productivity needs to come at the cost of sustainability. We can do good for ranchers, and the planet.

- Halter (as of 5/25)

*2025 figures annualized as of Q1:25. Source: Halter (5/25)

Halter Net New Collars Contracted (K) – 2023-2025*, per Halter

Thanks to the rise in low-cost satellite-driven Internet connectivity / access, the potential for the 2.6B (or 32% of the world's population) that is not online to come online is increasing.

These new users will start from scratch with AI functionality. Wow!

When these new users come online, they likely won't be met by browsers and search bars.

They'll start with AI – and in their native language.

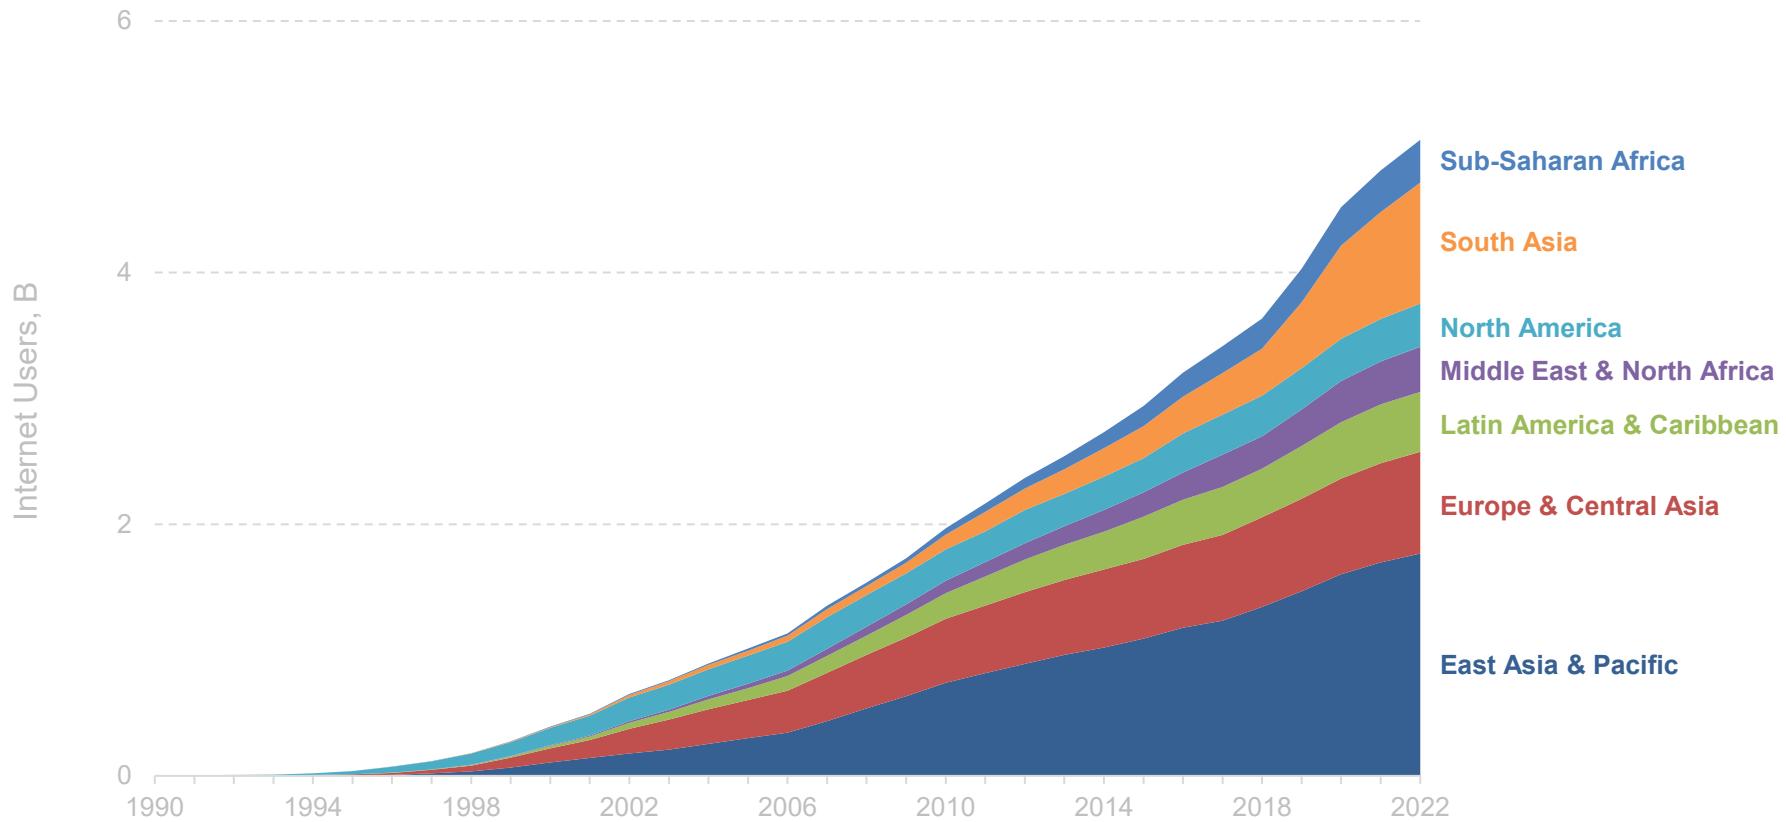

Imagine a 'first experience' of the internet that doesn't involve typing a query into a search engine but instead talking to a machine that talks back.

Imagine skipping the traditional application layer entirely, with an agent-driven interface managing disparate tech platforms from one place while understanding users' local language, context, and intent. An agent-first internet experience could upend existing tech hierarchies, disintermediating dominant platforms and redistributing value.

In this model, the winners wouldn't be those who own the app, but those who own the interface.

Global Internet Users = Epic Growth Over Past Thirty-Three Years, per ITU

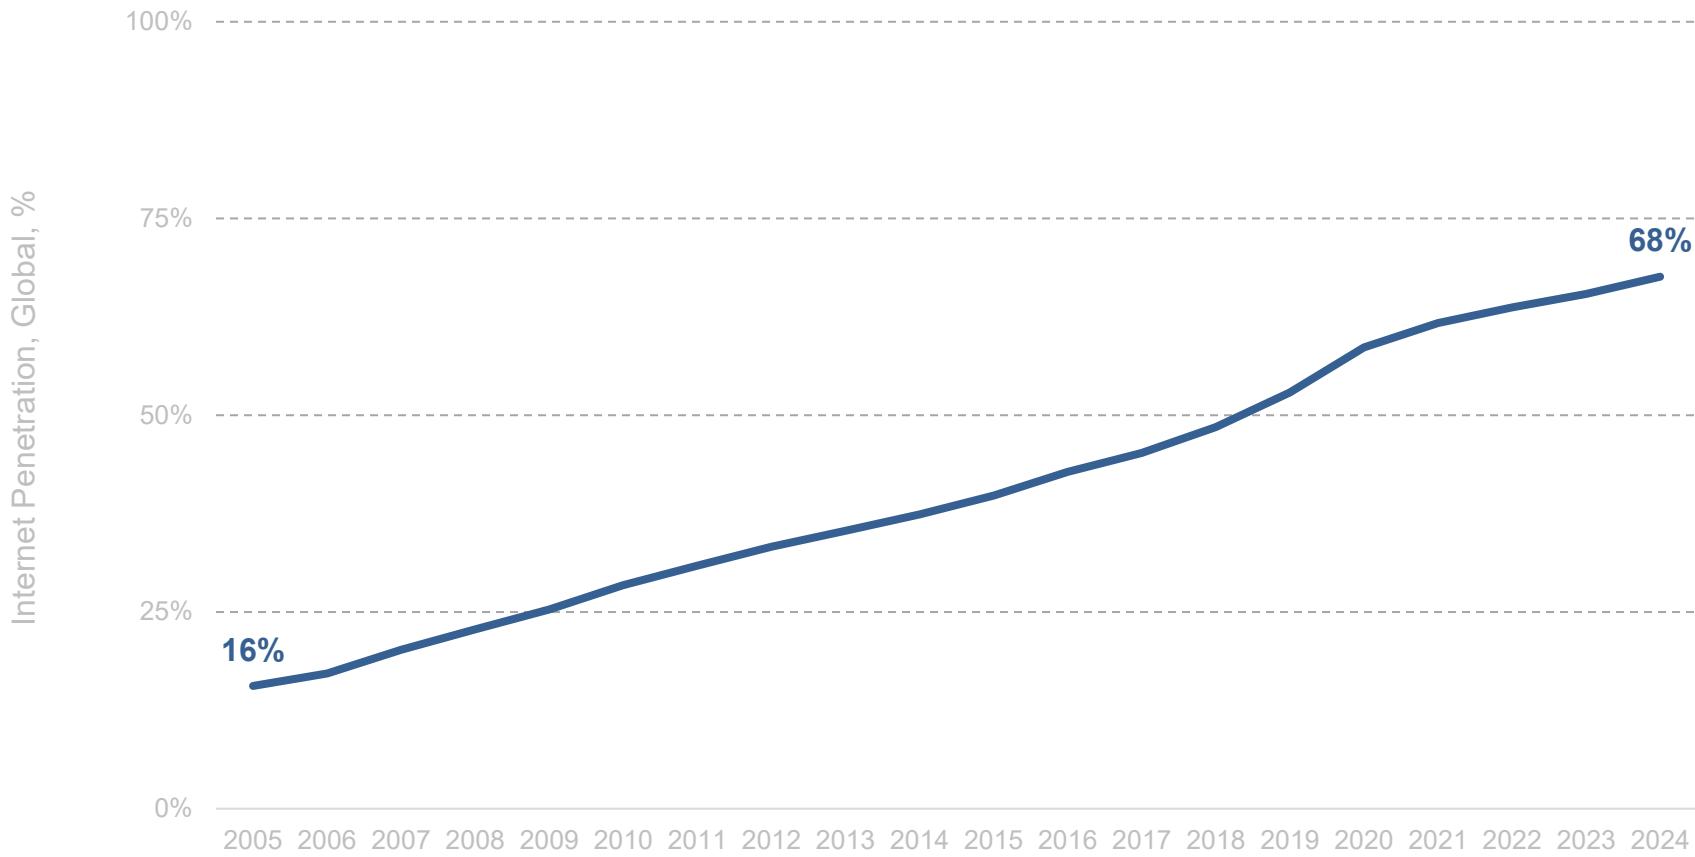

Internet Users by World Region (B) – 1990-2022, per ITU

Starlink = Unlocking Previously-Inaccessible Internet Access in AI Era

Select Global Starlink Use Cases – 4/25, per SpaceX

Coco, Monterrey, Mexico

Starlink's technology has enabled Coco's operations, delivering high-speed, reliable internet that bridges the digital divide in rural Mexico. Through our streamlined community WiFi services, we're not just offering connectivity, we're opening a window to the world for hundreds in remote areas. With Starlink, we've boosted connection speeds and efficiency, transforming disconnected regions into digitally engaged communities.

Chile School District

[Our] school went from slow, ineffective connectivity for even 2-3 computer stations, to having high-speed internet where all 36 of our children can have effective internet connectivity simultaneously...a class-changing event for our teachers and students.

Brightline Trains, USA

Starlink gave us the new beginning we were looking for. It gave us connectivity we can be proud to share with our guests. It gave us the knowledge we needed to continue to build better train connectivity beyond the satellite [internet] itself...and, most of all, it gave us a new beginning for train enthusiasts to get excited about because it is doable, it is maintainable, [and] it is as exciting as it seems.

Seaspan Corporation, Global

Deploying SpaceX Starlink's low Earth orbit, low-latency, high bandwidth service across our fleet is a major milestone in addressing connectivity challenges in an industry with a global and mobile workforce. It allows us to treat our vessels no differently than remote offices, supporting crew safety and wellness – and it enables us to develop new solutions that were technically and financially unviable just a few years ago.

AI is foundationally changing the way we work. Alongside growth in physical automation (think adoption of robots and drones), we are now also seeing the rise of cognitive automation, where AI systems can reason, create, and solve problems. The ramifications are widespread.

The pace of improvement in AI's cognitive ability is astounding.

In the three years since ChatGPT's 11/22 public launch, we've gone from the reasoning capabilities of a high school student to those of a PhD candidate. Professions centered on intaking large bodies of structured, historical data and outputting rules-based decisions and judgement, fall squarely in the core competency of generative AI.

In this emerging landscape, a unit of labor could shift from human hours to computational power.

Data centers and foundation models – in many instances – could dictate the availability and quality of certain types of labor.

As a result, some tout an 'agentic future' where AI agents replace humans in many white-collar jobs.

Although possible, history and pattern recognition suggest the role of humans is enduring and compelling. Technology-forward leaps have typically driven productivity and efficiency gains and more – but new – jobs. That said, this time it's happening faster.

In an extreme, entirely agentic future, humans maintain a role in the system, pivoting towards oversight, guidance, and training.

Imagine facilities filled with humans teaching robots intricate movements or offices full of workers providing reinforcement learning* human feedback (RLHF) to optimize algorithms. This is not conjecture.

Companies like Physical Intelligence and Scale AI, respectively, are building powerful businesses based on this view of the world.

The idea of the human workforce re-configured to teach and refine machines as a primary function might sound dystopic. But it's worth remembering historical parallels. Fifty years ago, this prospect of rows of cubicles and uniformed office workers sitting quietly in front of LED computers ten hours a day likely sounded equally dystopic. Yet here we are.

Technology has constantly redefined and evolved the nature of work and productivity...AI is no different.

**Reinforcement Learning = An ML approach where agents learn by receiving rewards or penalties for actions.*

AI Impact on Business = Diverse & Broad

AI In Workforce – Shopify = Reflexive AI Usage Is Now a Baseline Expectation...

We are entering a time where more merchants and entrepreneurs could be created than any other in history. We often talk about bringing down the complexity curve to allow more people to choose this as a career. Each step along the entrepreneurial path is rife with decisions requiring skill, judgement and knowledge.

Having AI alongside the journey and increasingly doing not just the consultation, but also doing the work for our merchants is a mind-blowing step function change here.

Our task here at Shopify is to make our software unquestionably the best canvas on which to develop the best businesses of the future. We do this by keeping everyone cutting edge and bringing all the best tools to bear so our merchants can be more successful than they themselves used to imagine.

For that we need to be absolutely ahead.

Reflexive AI usage is now a baseline expectation at Shopify.

Maybe you are already there and find this memo puzzling. In that case you already use AI as a thought partner, deep researcher, critic, tutor, or pair programmer. I use it all the time, but even I feel I'm only scratching the surface.

It's the most rapid shift to how work is done that I've seen in my career...

...Using AI effectively is now a fundamental expectation of everyone at Shopify.

It's a tool of all trades today, and will only grow in importance. Frankly, I don't think it's feasible to opt out of learning the skill of applying AI in your craft; you are welcome to try, but I want to be honest I cannot see this working out today, and definitely not tomorrow.

Stagnation is almost certain, and stagnation is slow-motion failure. If you're not climbing, you're sliding...

Shopify Co-Founder & CEO Tobias Lütke in Internal Memo on AI – 3/25

Source: Tobi Lutke via X (4/25), Shopify

...AI In Workforce – Duolingo = Duolingo Is Going to be AI-First

I've said this in Q&As and many meetings, but I want to make it official: Duolingo is going to be AI-first.

AI is already changing how work gets done. It's not a question of if or when. It's happening now. When there's a shift this big, the worst thing you can do is wait. In 2012, we bet on mobile. While others were focused on mobile companion apps for websites, we decided to build mobile-first because we saw it was the future. That decision helped us win the 2013 iPhone App of the Year and unlocked the organic word-of-mouth growth that followed...

...AI isn't just a productivity boost. It helps us get closer to our mission. To teach well, we need to create a massive amount of content, and doing that manually doesn't scale. One of the best decisions we made recently was replacing a slow, manual content creation process with one powered by AI. Without AI, it would take us decades to scale our content to more learners. We owe it to our learners to get them this content ASAP...

...Being AI-first means we will need to rethink much of how we work. Making minor tweaks to systems designed for humans won't get us there...We can't wait until the technology is 100% perfect. We'd rather move with urgency and take occasional small hits on quality than move slowly and miss the moment.

We'll be rolling out a few constructive constraints to help guide this shift...:

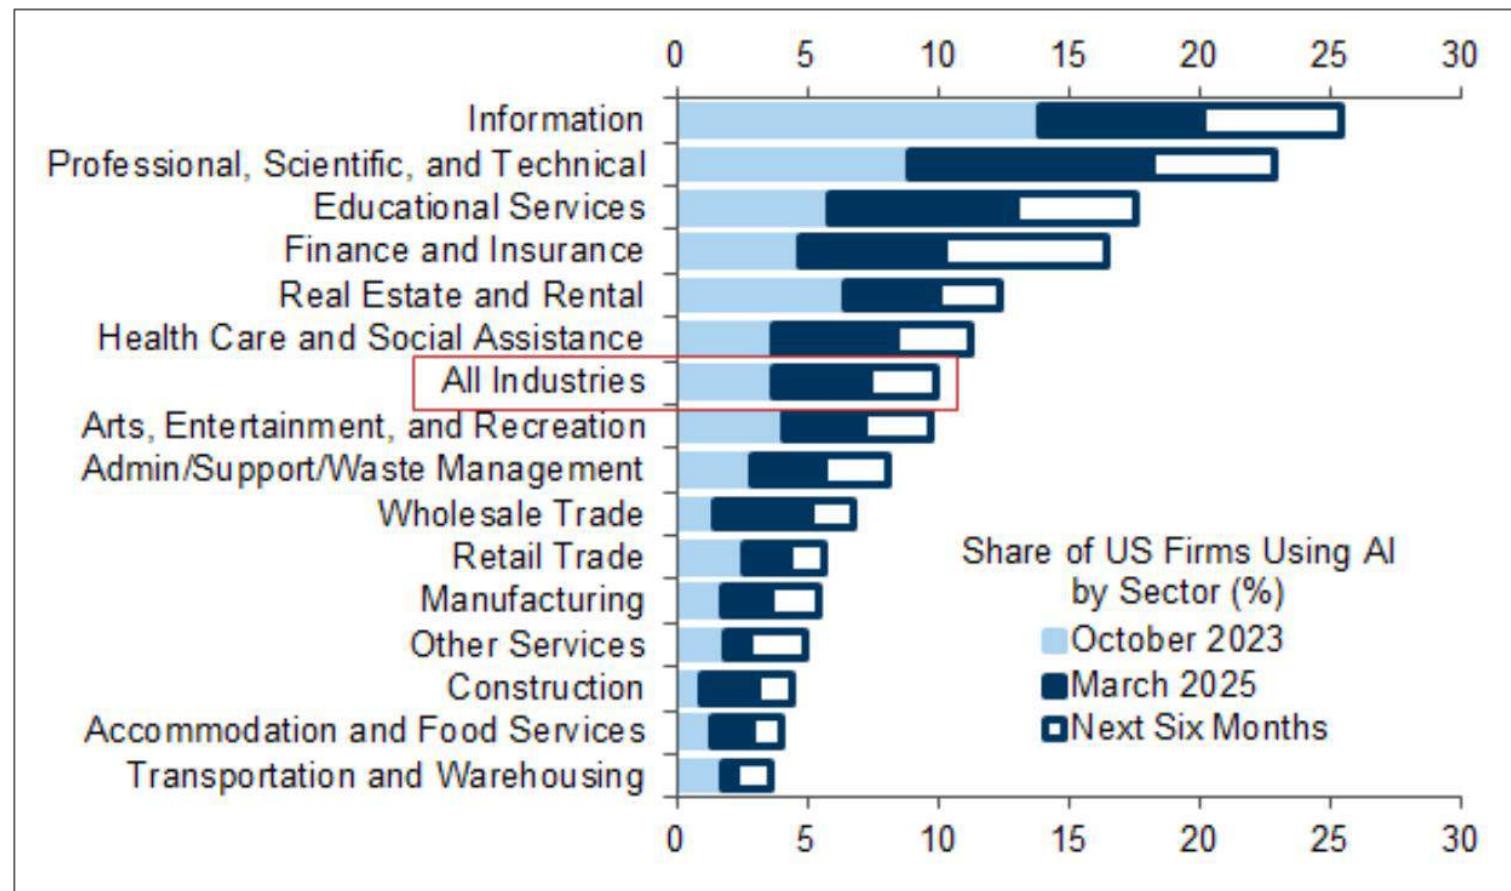

- *...AI use will be part of what we look for in hiring*
- *AI use will be part of what we evaluate in performance reviews*
- *Headcount will only be given if a team cannot automate more of their work*
- *Most functions will have specific initiatives to fundamentally change how they work...*

Apple Job Postings Related to ‘Generative AI’ – 5/25

The screenshot shows the Apple Careers website interface. At the top, there is a navigation bar with links for Store, Mac, iPad, iPhone, Watch, Vision, AirPods, TV & Home, Entertainment, Accessories, and Support. Below the navigation is a search bar with the placeholder 'Search' and a magnifying glass icon. A green dashed box highlights the search bar with the text 'Generative AI'. Below the search bar, a banner says 'Find your perfect role.' and 'Most corporate roles require English-language skills.' The main content area shows a search results table. The table has a header row with columns for 'Refine by', 'Result(s)', 'Title', 'Location', and 'Sort by: Relevance'. The results are as follows:

Refine by	Result(s)	Title	Location	Sort by: Relevance
Location	600+ Result(s)	Generative AI Quality Engineer	Cupertino	
Keyword		Software and Services

Example job description:

As a member of the team you will be responsible for bringing innovative ideas and applying modern machine learning methods to solve problems that matter. From ideation to productization, you will participate in the full development cycle of core technologies, including handwriting and text recognition, handwriting synthesis, document understanding, freeform drawing recognition and generation. The ideal candidate should have experience in computer vision, speech recognition, deep learning, and/or other applications of machine learning systems.

USA Labor Productivity = Has Happened Alongside Job Growth Over Seventy-Seven Years

**Relative Change in USA Non-Farm Employment & Labor Productivity – 1947-2024,
per Federal Reserve Bank of St. Louis**

Note: Here we define the start of the PC Era as 1981 (launch of IBM PC). We define the start of the desktop internet era as 1995 (Netscape's IPO). We define the start of the mobile internet era as 2007 (the launch of Apple's iPhone). We define the start of the AI Era as 2022 (the public launch of ChatGPT). AI In Workforce – NVIDIA =

You're Not Going to Lose...Your Job to an AI...[But] to Somebody Who Uses AI

All of you have heard a lot about [AI] job displacement. Every job will be affected. Some jobs will be lost, some jobs will be created, but every job will be affected. And immediately it is unquestionable, you're not going to lose a job – your job to an AI, but you're going to lose your job to somebody who uses AI...

...But let me give you the two extremes that you might want to consider as well.

Computer technology, computer science has benefited about 30 million people.

There are about 30 million people in the world who know how to program and use this technology to its extreme...

...The other eight, seven and a half billion people don't. I'll put on the table that, in fact, artificial intelligence is the greatest opportunity for us to close the technology divide.

And let me prove it to you. You know, if we just look in this room, it's very unlikely that more than a handful of people know how to program with C++, and an equal number know how to program in C. And yet, 100 percent of you know how to program in AI. And the reason for that is because the AI will speak whatever language you wanted to speak...

...The number of people who are using ChatGPT and Gemini Pro and these AIs kind of demonstrate that, in fact, this is one of the easiest to use technologies in history...

*...The other extreme that I will say is that, remember, we're – we have a shortage of labor.
We have a shortage of workers.*

We don't have an abundance of workers. We have a shortage of and for the very first time in history, we actually have – we can imagine the opportunity to close that gap to put 30-40 million workers back into the workforce that otherwise the world doesn't have. And so you could argue that artificial intelligence is probably our best way to increase the GDP, the global GDP, and so those are two other ways to look at it.

In the meantime, I would recommend 100% of everybody you know take advantage of AI and don't be that person who ignores this technology.

NVIDIA Co-Founder & CEO Jensen Huang @ Milken Institute Global Conference – 5/25

Summary...

Imagine, for a moment, how different your next week would look if there were no internet. Every facet of modern life – how we work, how we communicate, how we govern, and more – would likely be turned on its head. The internet has been woven into so many facets of life, big and small, that – for many – it is difficult to imagine a world without it.

In the next decade or two, imagining a world without AI will likely feel the same.

Artificial intelligence is reshaping the modern landscape at breakneck speed. What began as research has scaled into emerging core infrastructure across industries – powering everything from customer support to software development, scientific discovery, education, and manufacturing. This document has aimed to map the pace and breadth of AI's expansion, with particular focus on usage trends, cost dynamics, infrastructure buildout, and early monetization models.

The through-line is clear: AI is accelerating, touching more domains, and becoming more embedded in how work gets done.

Catalyzing this growth is the global availability of easy-to-use multimodal AI tools (like ChatGPT) on pervasive mobile devices, augmented by a steep decline in inference costs and an explosion in model availability. Both closed and open-source tools are now widely accessible and increasingly capable, enabling solo developers, startups, and enterprises alike to experiment and deploy with minimal friction. Meanwhile, large tech incumbents are weaving AI deeper into their products – rolling out copilots, assistants, and even agents that reframe how users engage with technology. Whether through embedded intelligence in SaaS or agentic workflows in consumer apps, the interface layer is being rewritten in real time.

On the compute side, investment continues to scale dramatically. Capital expenditures across major cloud providers, chipmakers, and hyperscalers have hit new highs, driven by the race to enable real-time, high-volume inference at scale. The investment is not just in chips, but also in new data centers, networking infrastructure, and energy systems to support growing demand. Whether this level of capital expenditure persists remains to be seen, but as AI moves closer to the edge – in vehicles, farms, labs, and homes – the distinction between digital and physical infrastructure continues to blur.

The global race to build and deploy frontier AI systems is increasingly defined by the strategic rivalry between the United States and China. While USA companies have led the charge in model innovation, custom silicon, and cloud-scale deployment to-date, China is advancing quickly in open-source development, national infrastructure, and state-backed coordination.

Both nations view AI not only as an economic tailwind but also as a lever of geopolitical influence.

These competing AI ecosystems are amplifying the urgency for sovereignty, security, and speed...

...Summary

...In this environment, innovation is not just a business advantage; it is national posture.

As Microsoft Vice Chair and President Brad Smith recently noted,

Given the nature of technology markets and their potential network effects, this race between the U.S. and China for international influence likely will be won by the fastest first mover. Hence, the United States needs a smart international strategy to rapidly support American AI around the world...

...The Chinese wisely recognize that if a country standardizes on China's AI platform, it likely will continue to rely on that platform in the future. The best response for the United States is not to complain about the competition but to ensure we win the race ahead. This will require that we move quickly and effectively to promote American AI as a superior alternative.

And it will need the involvement and support of American allies and friends.

Lastly, AI is changing how we interact with the world around us. With affordable satellite connectivity expanding access to remote and underserved regions, the next wave of internet users will likely come online through AI-native experiences – skipping traditional app ecosystems and jumping straight into conversational, multimodal agents.

Similarly, AI uptake is accelerating in the workplace and has the potential to shape how people spend the one third of their lives at work. As usage patterns evolve and unit costs decline, we may be witnessing the early stages of an internet where intelligence is the default interface – accessible, contextual, and increasingly personal.

This is all amplified by the growing flow and transparency of information and capital – and the increasing examples of weaponization.

It comes at a time when global powers are more openly asserting autocracy-versus-democracy agendas. As technology and geopolitics increasingly intertwine, uncertainty is rising.

One thing is certain – it's gametime for AI, and it's only getting more intense... and the genie is not going back in the bottle.

BOND is a global technology investment firm that supports visionary founders throughout their entire life cycle of innovation and growth. BOND's founding partners have backed industry pioneers including Airbnb, AlphaSense, Applied Intuition, Canva, DocuSign, DoorDash, KoBold Metals, Meta (Facebook), Instacart, Peloton, Plaid, Revolut, Slack, Spotify, Square, Stripe, Twitter, Uber, & VAST Data.
